1 Introduction

Congratulations on your purchase of the **Opus Building Acoustics Suite**. This sub suite contains several building acoustics related modules and is itself part of the **Opus Software Suite**.

The **Opus Software Suite** is a sound and vibration software that contains several measurement modules:

- SLM 4-ch module : 4-channels, Class 1 (IEC 61672 and ANSI S1.43)
- SLM & 3Vib module : 1 SLM channel (same as SLM 4-ch module) and 3 vibration channels (ISO 8041 and ISO 2631)
- Data Logger module
- Building Acoustics Suite
 - Sound Transmission (ASTM E 336/ISO 140-4)
 - Impact Insulation (ASTM E 1007/ISO 140-7)
 - Room Noise (ANSI/ASA S12.2-2008)
 - Reverberation Time (ISO 3382)
 - Speech Privacy (ASTM E 2638 and ASTM E 1130)
- Building Vibration module (DIN 45669-1 and ANSI S2.46)
- Intensity module (IEC 1043)
- Hammer Impact module
- Power Transformer Suite

The **Opus Suite** is intended to run on a **Concerto**. The software can also be installed on a Conductor unit or on any PC if using an Alto unit. Moreover, some post-processing functions are available on a PC even if no compatible unit is detected.

The current user's manual presents the modules of the **Building Acoustics Suite**:

Module Name	Description	Standards	Section
STC	Airborne Sound Isolation between Rooms	ASTM E 336 ISO 140-4	Section 4, page 8
IIC	Impact sound insulation of floors	ASTM E 1007 ISO 140-7	Section 5, page 29
Room Noise	Room noise	ANSI/ASA S12.2-2008	Section 6, page 51
RT-60	Reverberation Time	ISO 3382	Section 7, page 67
E2638	Speech Privacy Provided by a Closed Room	ASTM E 2638	Section 8, page 84
E1130	Privacy Speech Privacy in Open Offices	ASTM E 1130	Section 9, page 102

2 Compatible Hardware

Every hardware option has an embedded state of the art Soft dB SR-MK3 DSP board allowing real-time and precise measurement with very low energy consumption.

Concerto

Handy, lightweight, fully rugged military tablet
All in one instrument
WLAN communication allows using the Concerto as a monitoring station with remote access.
<http://www.softdb.com/en/acoustic/products/concerto.php>

Alto

6 or 4 24-Bit asynchronous inputs and 2 outputs
Compact, low-consumption, and flexible
Needs to be connected to a PC.
Competitive price.
<http://www.softdb.com/en/acoustic/products/alto.php>

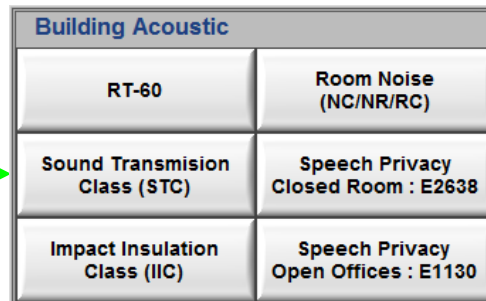

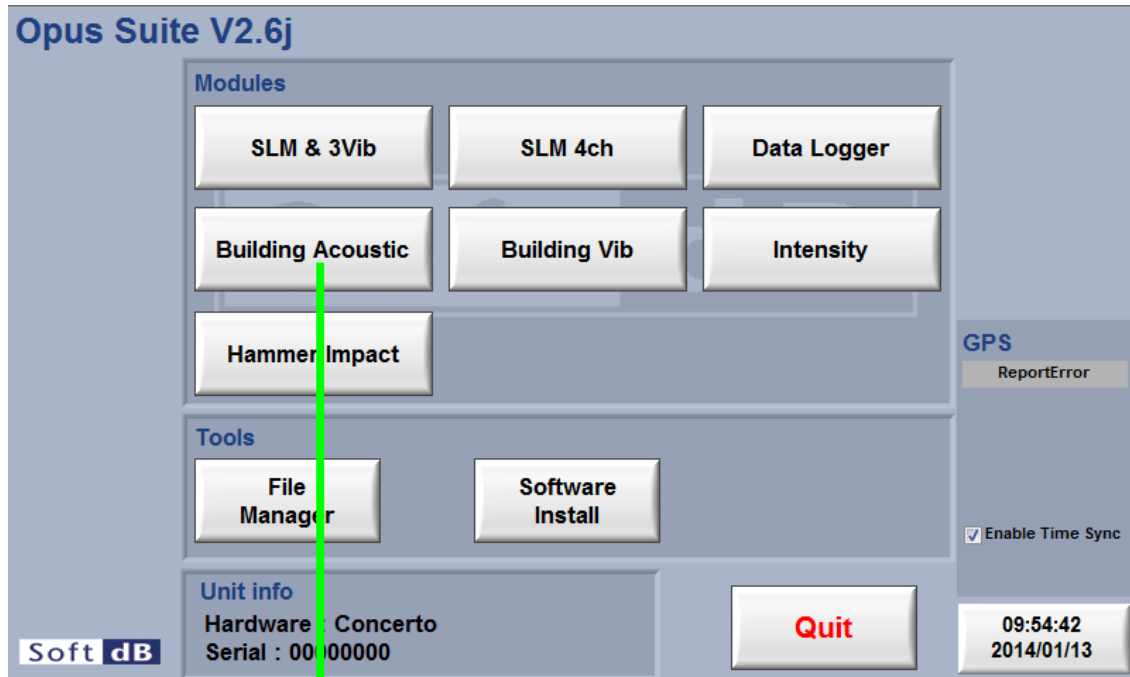

Conductor

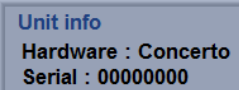

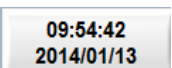

Rugged platform for acoustics and vibration measurements.
Mainly used for the I-Track sound intensity mapping system.
<http://www.softdb.com/en/acoustic/products/conductor.php>

3 Opus Environment

The **Concerto** unit comes equipped with the **Opus** Environment. This environment acts as a main interface that gives access to the different modules and tools.

<p>Modules</p>	<p>The module buttons launches the associated module. When the license of a module is not found, the text of its button is greyed, but the module can still be opened to access measurement files.</p>
	<p>The File Manger button launches the File Manager Utility (see section 11, p. 124)</p>
	<p>The Software Install button launches a browser from which an Opus software installer can be launched.</p>
	<p>The Network Manager button launches the Network Manager interface. This tools is only available on a Concerto unit</p>
	<p>The Unit info gives the information about the hardware type (Concerto, Alto or Conductor) and the serial number of the unit.</p>
	<p>The Clock indicator displays the time and date on the unit. To change time, simply click on the indicator to display a dialog window.</p>
	<p>The Quit button quits the application differently according to the hardware used.</p> <p>Concerto hardware:</p> <ul style="list-style-type: none"> • Hold 5 sec to shut down the unit. • Press and release to enter standby mode. <p>Alto or Conductor hardware:</p> <ul style="list-style-type: none"> • Press and release to close the application and return to Windows.

4 STC module

General Specifications

Standards	Test Method ASTM E336-05 and Test Method ISO 140-4 Standard Test Method for Measurement of Airborne Sound Attenuation between Rooms in Buildings. Both standards are designed to measure the sound isolation a partition between two rooms. The result is expressed as a Sound Transmission Class (STC) index. The two standards differ slightly in the frequency range that is considered for the evaluation. The ASTM ranges from 125 to 4000 Hz. The ISO ranges from 100 to 3150 Hz.
Software Features	<ul style="list-style-type: none">• Intuitive interface for STC measurement• Embedded noise generator (white or pink noise)• Real time 1/3 octave band spectrum (IEC 1260 Type 1)• Reverberation evaluation with auto interrupted method• Automated calculation of the STC Index• Expendable interface to allow repetitions of a measurement type.• Multiple partitions in the same file• Save, load and export measurement files

4.1 STC Quick Start

The STC module is part of the Building Acoustics. It can be accessed in the Building Acoustics menu of the Opus Suite panel.

Elements to measure

Measure the selected element

What you should know...

- The partition area and the receiving room volume are used to evaluate de STC.
- You need at least 4 measurements: level in the source room (source on), level in the receiving room (source on), background level in the receiving room (source off) and reverberation time in the receiving room.
- The main interface let do an unlimited quantity of measurements for every type of data.
- Select the corresponding column header to see the average of the different measurements of a type of data.
- The selected element of the table shows a **green background**. The details of the selection are displayed on the right side of the table.
- The elements still to measure display a question mark (?) as a value and have a **yellow background**.

Step 1 Setup the unit

Input Setup				
Channel	Type	Range	Sensitivity	dBref
1	ICP	25-119 dBA	50.0 mV/Pa	2E-5

Level Measurement Setup					
Source	Source Type				
External	External				
Period	20 sec	SourceOFF	20 sec	SourceON	20 sec
Type	Leq	Type	Leq		
Y-axis range	Y min	20	Y max	90	

Reverberation Measurement Setup		
Source	Source Type	Volume
PinkNoise	PinkNoise	100%
Measurement Length	2,0 sec	
Number of Average	5	

Buttons: Cancel, OK

Click on the  button to access the setup interface. The parameter should typically be set as shown on figure above.

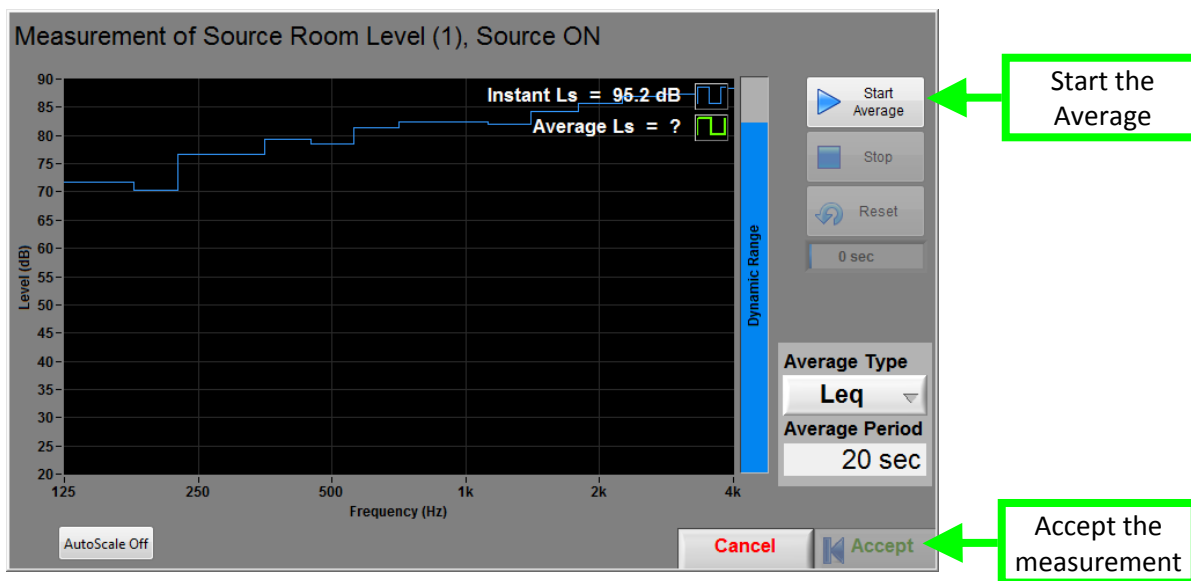

Before a measurement, the operator should set the sensitivity of the sensor used. This sensitivity can be set manually if it is known. Preferably, the sensor sensibility should be set by using the software calibration tool and a calibrator. To do so, click on  and follow the instructions of the Sensor Calibration (section 4.3.1, p.18).

The level measurement can be made using an external generator or the internal generator (pink or white noise).

Click  to return to the main panel.

Step 2 Do a Level Measurement

To proceed to a measurement, select an element to measure in the table of the main panel and click

the button to open the measurement interface.

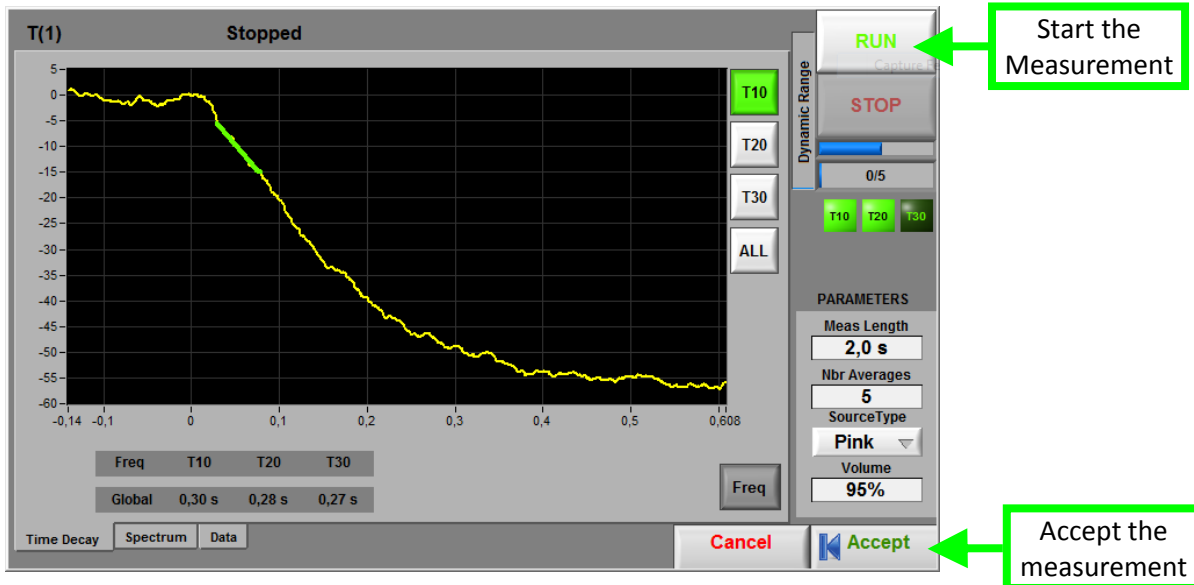

Once in the measurement panel, click on the button to start the average measurement. The acquisition end by itself once the average period is reached (as set in setup) and can be stopped at any time.

Click on the button to accept the measurement.

- An omnidirectional should be used
- Source at least 5 m away from the partition if possible. Otherwise, in the opposite corners of the room.
- If several source positions, the distance between positions should be at least 2 m.
- For a fixed position measurement, the averaging time should be at least 10 seconds.
- For a moving average measurement, the averaging time should be at least 30 seconds.
- The microphones must be kept more than 1 m away from the tested partition.
- If possible, the microphones should be kept more than 1 m away from all other major extended surface or 0.5 m away otherwise.
- The microphones should be kept way from the source: >1m if room <25m³, >1.5m if room <100m³, >2m if room >100m³.
- If fixed microphone positions is used, at least 6 positions (as least 1 m apart) should be used for each room.
- If moving microphones is used, the microphone speed should not exceed 0.5 m/s.

Step 3 Do a Reverberation Measurement

To proceed to a reverberation measurement, select an element to measure in the table of the main

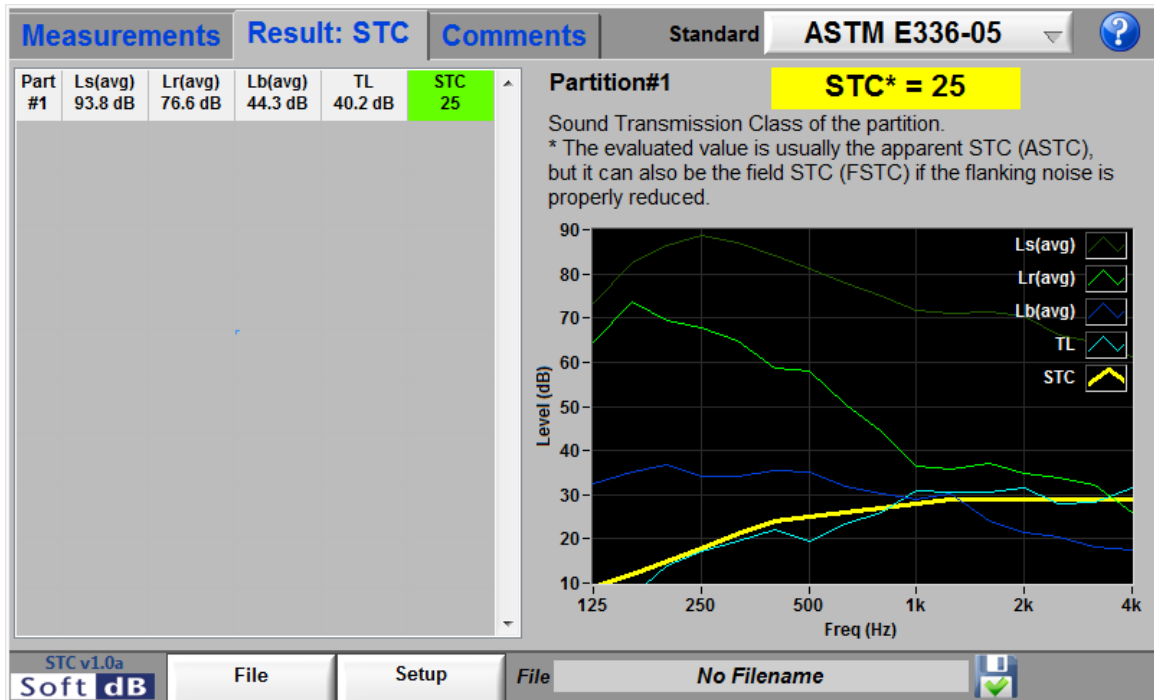

panel and click the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the reverberation measurement. The acquisition ends by itself once the number of averages is reached.

Click on the  button to accept the measurement.

- An omnidirectional microphone should be used
- A first source position should be in center of the receiving room.
- Several fixed microphone locations should be used.
- Keep the microphone at least 1 meter away from any major extended surface.
- Keep the microphone at least 1 meter away from the source.
- The more source positions and the more microphone positions, the more the reverberation time will be representative.

Step 4 Analyze the results

The result tab displays the results of the sound transmission class to the evaluated partitions.

The measurements can be saved and exported through the menu of the  button.

4.2 STC Main Interface

File

4.3 STC Setup Interface

The screenshot shows the STC Setup Interface with the following settings:

- Input Setup:** Channel: 1, Type: ICP, Range: 25-119 dBA, Sensitivity: 50.0 mV/Pa, dBref: 2E-5. A Calibrate button is visible.
- Level Measurement Setup:** SourceType: External, Source: External, SourceOFF: 20 sec, SourceON: 20 sec, Type: Leq, Y-axis range: Y min: 20, Y max: 90.
- Reverberation Measurement Setup:** SourceType: PinkNoise, Source: PinkNoise, Volume: 100%, Measurement Length: 2,0 sec, Number of Average: 5.

Buttons for Cancel and OK are located at the bottom right.

Figure 2: Setup interface

Input Setup

Channel 1	The input channel used for the measurements
Type ICP	The available input types are AC and ICP sensors.
Range 25-119 dBA	Selection of the dynamic range. For a microphone sensitivity of 50mV/Pa. - Low Range: 25 to 119 dBA - High Range: 37-130 dBA <u>Concerto</u> : the input 1 and 2 have two range settings (Low or High) while inputs 3 and 4 have a single fixed range (Low). <u>Alto and Conductor</u> : only the low range is available.
Sensitivity 50.0 mV/Pa	The sensor sensitivity can be entered manually or the Calibration interface can be used (see section 4.3.1, p.18).
dBref 2E-5	The dB reference is the unit reference from which the decibel (dB) is calculated.

Level Measurement Setup

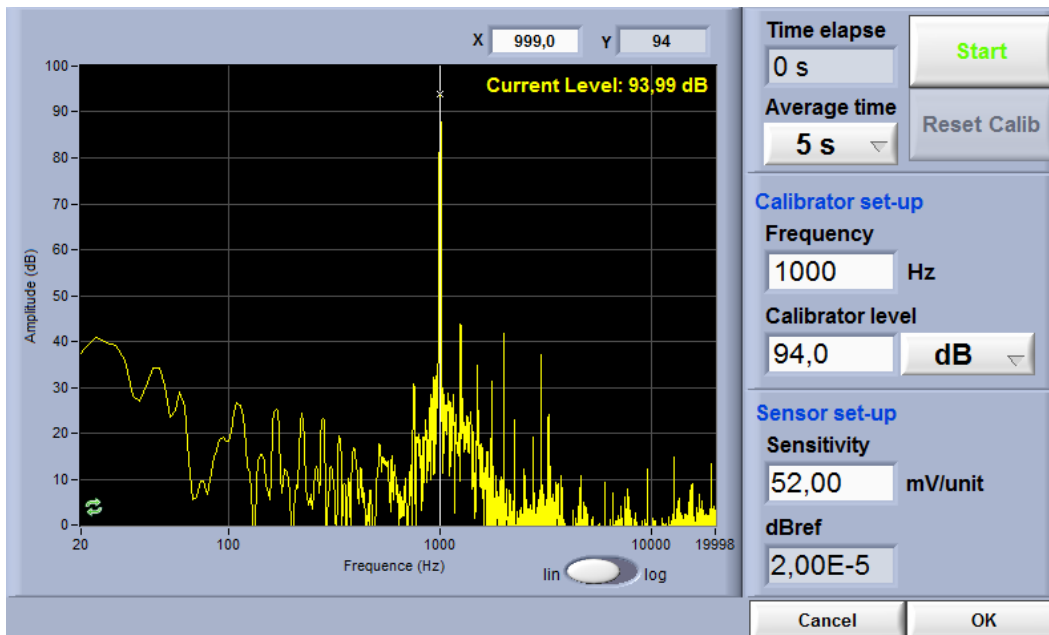

<p>Source Type External</p> <p>↓</p> <p>PinkNoise WhiteNoise External</p>	<p>The unit can be used to generate a pink noise or a white noise. The output signal is balanced on output 1 and output 2.</p> <p>If an external generator is used, the source type can be set to external. This disables the outputs.</p>				
<p>Volume 50%</p>	<p>When an internal generator is used, the volume can be adjusted from 0 to 100%.</p>				
<p>Period 20 sec</p>	<p>The average period of the two types of level measurement can be adjusted independently.</p>				
<p>Type Leq</p> <p>↓</p> <p>✓ Leq L99% L95% L90% L50%</p>	<p>The average type of the two types of measurement can be adjusted independently. It can be adjusted to be a plain average (Leq) or a statistic level (Lx%).</p> <p>Using the statistics instead of the Leq can minimize the punctual noise events that may occur during a measurement (especially for the background noise).</p>				
<p>Y-axis range</p> <table border="1"> <tr> <td>Y min</td> <td>Y max</td> </tr> <tr> <td>20</td> <td>90</td> </tr> </table>	Y min	Y max	20	90	<p>The Ymin and Ymax parameters set the vertical scale (levels in dB) of the spectrum graphs of the current module.</p>
Y min	Y max				
20	90				

Reverberation Measurement Setup

<p>Source Type External</p> <p>↓</p> <p>PinkNoise WhiteNoise</p>	<p>The unit is used to generate a pink noise or a white noise. The output signal is balanced on output 1 and output 2.</p>
<p>Volume 100%</p>	<p>The volume of the internal generator can be adjusted from 0 to 100%.</p>
<p>Measurement Length 2,0 sec</p>	<p>The measurement length is the duration of the noise emission of one iteration of the reverberation evaluation.</p>
<p>Number of Average 5</p>	<p>The number of average is the number of iterations used for the reverberation evaluation.</p>

4.3.1 Sensor Calibration

The input sensitivity can be calibrated using the calibration function and a sensor calibrator. Click the **Calibrate** button on the Setup interface to launch the Calibration interface.

Step 1 *Adjust the calibration parameters*

The default values are:

- Averaging time: 5 s
- Frequency: 1 kHz
- Calibrator Level: 94 dB

Step 2 *Install the calibrator device on the microphone*

Step 3 *Click START*

After the average time is elapsed, the sensitivity value will update.

Step 4 *Click OK to accept the sensitivity value*

4.4 STC Measurements tab

The Measurements tab can be divided in three parts. The partition information is in upper left corner. Just under is the table of measurements. Finally, the details of the selected element are on the right side.

Measurements controls

	<p>The partition menu let you select the partition to measure. To add a new partition, select the last element ("new...") of the menu ring.</p> <p>To delete a partition, select the partition and press the button</p>
	<p>The area (m²) of the partition to be qualified.</p>
	<p>The volume (m³) of the receiving room.</p>
	<p>The partition description let the user enter some basic information on the partition being qualified.</p>

	<p>If an element of the table is selected, the measurement interface will be called (see the following subsections).</p>
	<p>Click this button to delete the selected table element.</p>
	<p>The import feature allows the user to load one column of data (one of the 4 data types) from another partition of the same file. It is then possible to avoid repeating the same measurements when several partitions share data with each other.</p>

Table of Measurements

SOURCE ROOM	RECEIVING ROOM		Volume
	Source On	Source On	Source Off
			30 m ³
Ls(1) 93.8 dB	Lr(1) 76.6 dB	Lb(1) 44.3 dB	T(1) 0.27 sec
new...	new...	new...	new...

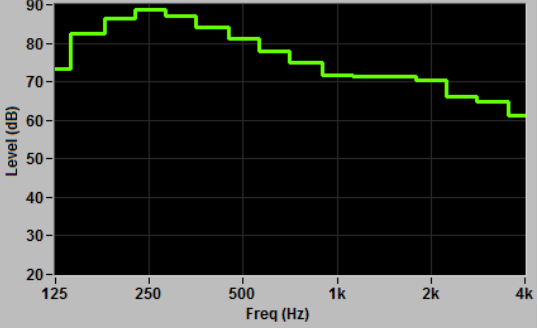

Source room Level measure Source on	Receiving room Level measure Source on	Receiving room Level measure Source off	Receiving room Reverberation
---	--	---	---------------------------------

The measurement table contains four columns for the four types of measurement:

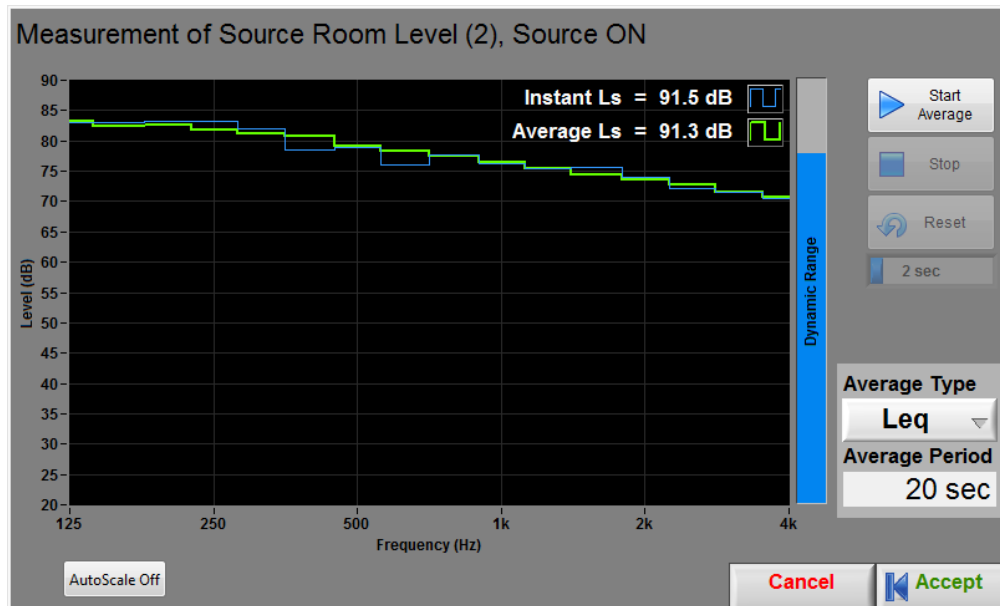

- Source room, level measurement, source on
- Receiving room, level measurement, source on
- Receiving room, level measurement, source off
- Receiving room, reverberation time measurement

Several measurements can be done for each of the four types. To add a new element in the table, simply press on “new...” in the proper column. The average value of those measurements will later be used in the STC evaluation. To see the average from the measurement tab, click on the header element above the first measurement element of a column.

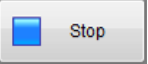

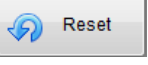

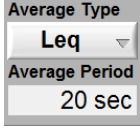

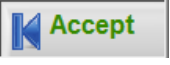

Details of the selected element in the table

4.4.1 STC Level Measurement Interface

Level Measurement controls

	<p>The Start/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process</p>
	<p>The Reset button restarts the average measurement.</p>
	<p>Progress bar of the average time.</p>
	<p>The average parameters of Average type and Average Period can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 4.3, p.16)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>
	<p>Once the measurement is acceptable, press the Accept button to return to the main interface.</p>

4.4.2 STC Reverberation Measurement Interface

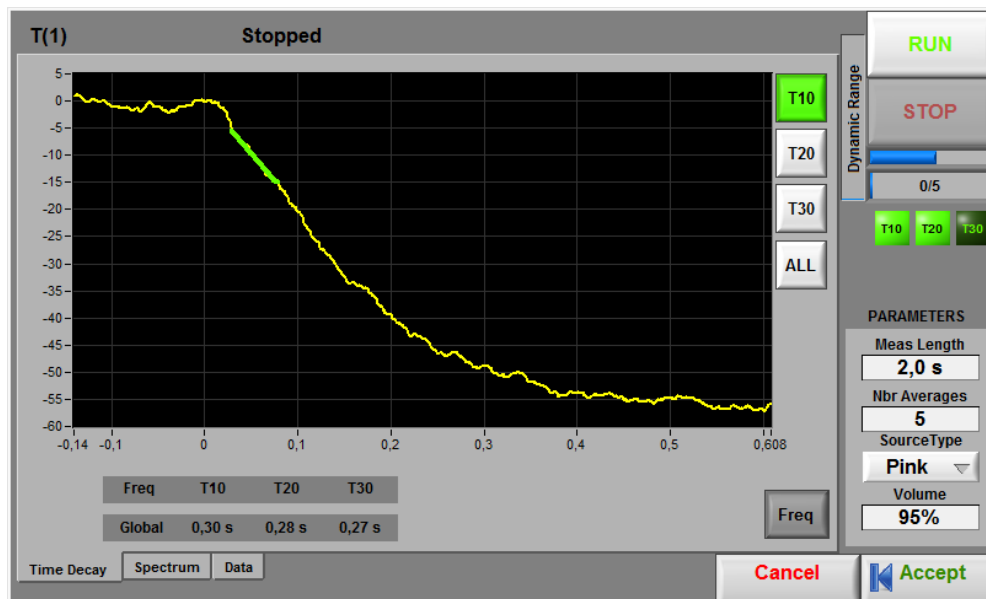

Figure 3: Reverberation Measurement Interface

Reverberation Measurement controls

	<p>The Run/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process.</p>
	<p>The upper progress bar is the progression of the current iteration. The bottom progress bar is the progression of the iterations relative to the requested "Nbr Averages".</p>
	<p>This indicator displays which reverberation indexes are met (i.e. if T10 is on, it means that T10 was reached for every frequency bands and global).</p>
	<p>The reverberation parameters can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 4.3, p.16)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>

Once the measurement is acceptable, press the Accept button to return to the main interface.

4.4.2.1 Reverberation: Time Decay

This display shows the response to a noise interruption. It also superimposes the curves used to evaluate the reverberation time values and the averaged successive responses.

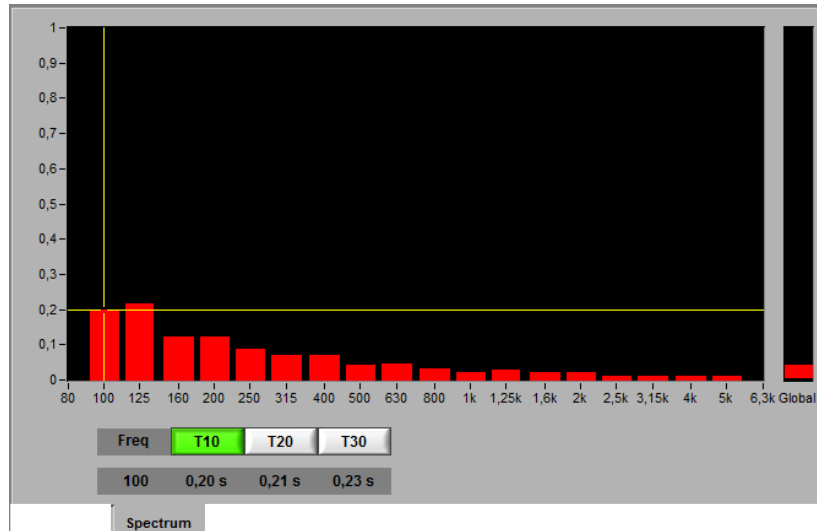

Figure 4: Time Decay tab of the reverberation

Time Decay Graph	This graph displays the time decay curves for the selected frequency band or global.								
	These buttons are used to select the visible curves on the time decay graph. T10 , T20 and T30 are the straight lines used to determine the reverberation times. All shows all the iterations in the averaging process.								
	These buttons are used to display the next or previous frequency band on the time decay graph and in the results.								
	This button is used to switch between frequency bands and global.								
<table border="1"> <thead> <tr> <th>Freq</th> <th>T10</th> <th>T20</th> <th>T30</th> </tr> </thead> <tbody> <tr> <td>100</td> <td>0,20 s</td> <td>0,21 s</td> <td>0,23 s</td> </tr> </tbody> </table>	Freq	T10	T20	T30	100	0,20 s	0,21 s	0,23 s	This array displays the computed results for the selected frequency band or global.
Freq	T10	T20	T30						
100	0,20 s	0,21 s	0,23 s						

4.4.2.2 Reverberation: Spectrum

This display shows a selected result for each frequency band and global using a bar graph. To select a frequency or the global, simply click the corresponding bar.

	<p>These buttons are used to select the result to display on the spectrum graph and Global Bar.</p>
	<p>This indicator displays the selected result for the global.</p>
	<p>This array displays the computed results for the selected frequency band or global. To select a frequency band, click on the spectrum at the desired frequency to move the cursor. To select the global, click on the global bar.</p>

4.4.2.3 Reverberation: Data

This display shows all data for all frequency bands and global in a table form.

Freq	T10	T20	T30
100	0,36 s	0,30 s	NaN s
125	0,32 s	0,45 s	NaN s
160	0,20 s	0,23 s	0,39 s
200	0,51 s	0,35 s	0,30 s
250	0,25 s	0,28 s	0,25 s

4.5 STC Result tab

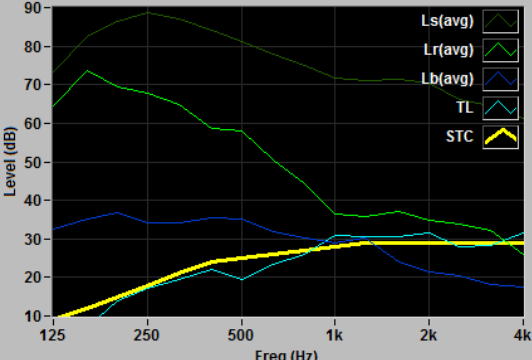

Figure 5: Result tab

The Result tab of the main interface contains the table of result (left side) and the details (right side). The table is expandable vertically as partitions are added (in the Measurements tab). Therefore, each line of the table gives the result of one partition.

Table of Results

Part #1	Partition index.
Ls(avg) 93.8 dB	Average level in the source room while the source is turned on.
Lr(avg) 76.6 dB	Average level in the receiving room while the source is turned on.
Lb(avg) 44.3 dB	Average background level in the receiving room while the source is turned off.
TL 40.2 dB	Transmission loss of the partition.
STC 25	Sound Transmission Class. This STC value is usually the apparent STC (ASTC), but can also be the field STC (FSTC) if the flanking noise is properly reduced.

Details of the selected element in the table

<p>Partition#1 STC* = 25</p> <p>Sound Transmission Class of the partition. * The evaluated value is usually the apparent STC (ASTC), but it can also be the field STC (FSTC) if the flanking noise is properly reduced.</p>  <p>Legend: Ls(avg) (green line) Lr(avg) (red line) Lb(avg) (blue line) TL (cyan line) STC (yellow line)</p>	<p>Name and value of the selected element. Description of the selected element</p> <p>Spectrum graph of the selected partition.</p>

4.6 Comments tab

Comments

Enter general description here

The Comments tab on the main panel can be used as a general note pad that will be saved along with the measurement data.

5 IIC module

General Specifications

<p>Standards</p>	<p>Test Method ASTM E1007 and Test Method ISO 140-7 Standard Test Method for Measurement of Tapping Machine Impact Sound Transmission Through Floor-Ceiling Assemblies and Associated Support Structures. Both standards are designed to measure the impact isolation between through floor-ceiling assemblies. The result is expressed as an Impact Insulation Class (IIC) index. The two standards have the same frequency range that is considered for the evaluation. The ASTM and ISO ranges from 100 to 3150 Hz.</p>
<p>Software Features</p>	<ul style="list-style-type: none"> • Intuitive interface for IIC measurement • Embedded noise generator (white or pink noise) • Real time 1/3 octave band spectrum (IEC 1260 Type 1) • Reverberation evaluation with auto interrupted method • Automated calculation of the IIC Index • Expendable interface to allow repetitions of a measurement type. • Multiple Floor-Ceiling Assemblies in the same file • Save, load and export measurement files

5.1 IIC Quick Start

The IIC module is part of the Building Acoustics. It can be accessed in the Building Acoustics menu of the Opus Suite panel.

Measurement tab

The screenshot shows the IIC software interface. The main window is titled 'Measurements' and 'Result: IIC*'. The current measurement is for 'Floor-Ceiling Assembly#1'. The receiving room volume is set to 40 m³. The table below shows the results for four positions (Li(1) to Li(4)) and their corresponding background levels (Lb(1) to Lb(4)) and reverberation times (T(1)).

RECEIVING ROOM			Volume
Source on	Source off	Reverb.	40 m³
Li(1) 63.4 dB	Lb(1) 33.9 dB	T(1) 0.09 sec	
Li(2) 64.0 dB	Lb(2) ?	new...	
Li(3) 64.2 dB	new...		
Li(4) 61.3 dB			
new...			

On the right, a graph shows the Level (dB) vs Freq (Hz) for the selected element. The level starts at approximately 60 dB at 100 Hz and decreases to about 35 dB at 3.1 kHz. The graph is titled 'Lr(1) = 63.4 dB' and 'Receiving Room Level (1), Source ON'.

At the bottom, there are buttons for 'Remove Lr(1)', 'Import Lr', and 'Measure Lr(1)'. The 'Measure Lr(1)' button is highlighted with a green box and an arrow pointing to it from the text 'Measure the selected element'. Another green box with an arrow points to the table from the text 'Elements to measure'.

What you should know...

- The receiving room volume is used to evaluate de IIC.
- You need at least 6 measurements: 4 levels in the receiving room (source on), 1 background level in the receiving room (source off) and 1 reverberation time in the receiving room.
- The main interface let do an unlimited quantity of measurements for every type of data.
- Select the corresponding column header to see the average of the different measurements of a type of data.
- The selected element of the table shows a **green background**. The details of the selection are displayed on the right side of the table.
- The elements still to measure display a question mark (?) as a value and have a **yellow background**.

Step 1 Setup the unit

Input Setup	
Channel	Type
1	ICP
Sensitivity	
50.0 mV/Pa	
<input type="button" value="Calibrate"/>	
dBref	
2E-5	

Level Measurement Setup	
Source	Externe
SourceOFF	60 sec
SourceON	60 sec
Period	60 sec
Type	Leq
Y-axis range	Y min: 20, Y max: 90

Reverberation Measurement Setup	
Source	PinkNoise
Source Type	PinkNoise
Volume	100%
Measurement Length	2,0 sec
Number of Average	5

Click on the  button to access the setup interface. The parameter should typically be set as shown on figure above.

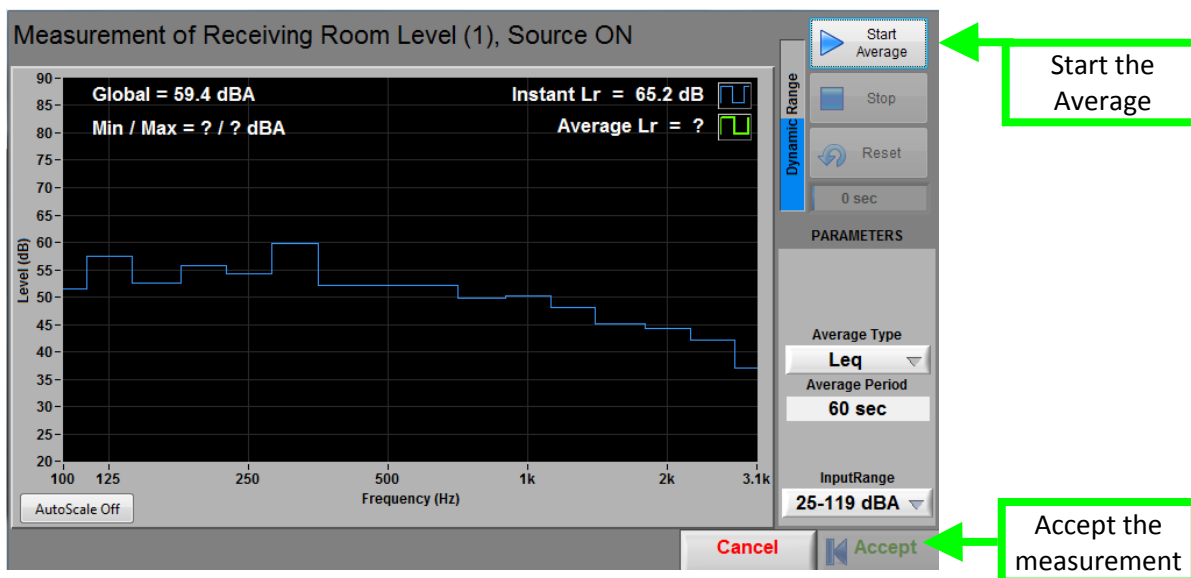

Before a measurement, the operator should set the sensitivity of the sensor used. This sensitivity can be set manually if it is known. Preferably, the sensor sensibility should be set by using the software calibration tool and a calibrator. To do so, click on  and follow the instructions of the Sensor Calibration (section 5.3.1.1, p.39).

The level measurement can be made using an external generator or the internal generator (pink or white noise).

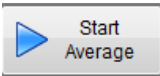

Click  to return to the main panel.

Step 2 Do a Level Measurement

To proceed to a measurement, select an element to measure in the table of the main panel and click

the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the average measurement. The acquisition ends by itself once the average period is reached (as set in setup) and can be stopped at any time.

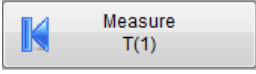

Click on the  button to accept the measurement.

- - An omnidirectional should be used (A13mm[0,5"])
- - For a fixed position measurement, the averaging time should be at least 10 sec.
- - For a moving average measurement, the averaging time should be at least 30 sec.
- - The microphones must be kept more than 1 m away from the tested top surface.
- - The microphone must be at 0,7m away from another microphone.
- - The microphone must be at 0,5m away from the part limits.
- - If fixed microphone positions is used, at least 4 positions (as least 1 m apart) should be used.
- - If moving microphones is used, the microphone speed should not exceed 0.5 m/s.
- - The tapping machine must be placed at 4 several positions.

Step 3 Do a Reverberation Measurement

To proceed to a reverberation measurement, select an element to measure in the table of the main

panel and click the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the reverberation measurement. The acquisition end by itself once the number of averages is reached.

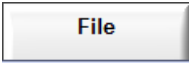

Click on the  button to accept the measurement.

- An omnidirectional should be used
- A first tapping machine position should be in center of the receiving room.
- Several fixed microphone locations should be used.
- Keep the microphone at least 1 meter away from any major extended surface.
- Keep the microphone at least 1 meter away from the tapping machine.
- The more source positions and the more microphone position, the more the reverberation time will be representative.

Step 4 Analyze the results

The result tab displays the results of the sound transmission class to the evaluated Floor-Ceiling Assembly.

The measurements can be saved and exported through the menu of the  button.

5.2 IIC Main Interface

Figure 6: Main interface

Main controls and indicators

 	Main interface tabs: <ul style="list-style-type: none"> • Measurements tab (section 5.4, p.43) • Result tab (section 5.5, p.48) • Comments tab (section 5.6, p.50)
	File Menu button (see the following table).
	Setup button that calls the setup interface (section 5.3, p.37).
	Module name and version number.
	File name of the measurement. A green check on the disk icon indicates that the data are saved.
	Click this button to display the help window. This help is a reminder of the steps and the rules to follow.

File Menu

New Open Save Save As... Export File Manager Quit	New	Creates a brand new measurement session.
	Open	Opens a previous measurement file.
	Save	Saves the current measurement into the specified file.
	Save As...	Saves the current measurement into a new file.
	Export	Exports the measurement data into a text file. The file is saved as .xls extension and can be opened with Microsoft Excel or any text editor.
	File Manager	Launches the File Manager (see section 11, p.124)
	Quit:	Allows to quit the module and to return to the Opus Suite Interface.

5.3 IIC Setup Interface

The screenshot shows the IIC Setup Interface with the following settings:

- Input Setup:** Channel: 1, Type: ICP, Sensitivity: 50.0 mV/Pa, dBref: 2E-5. A "Calibrate" button is visible next to the sensitivity field.
- Level Measurement Setup:** Source: Externe, SourceOFF: 60 sec, SourceON: 60 sec, Type: Leq, Y-axis range: Y min: 20, Y max: 90.
- Reverberation Measurement Setup:** SourceType: PinkNoise, Volume: 100%, Measurement Length: 2,0 sec, Number of Average: 5.

Buttons for "Cancel" and "OK" are located at the bottom right of the interface.

Figure 7: Setup interface

Input Setup

Channel 1	The input channel used for the measurements
Type ICP	The available input types are AC and ICP sensors.
Range 25-119 dBA	Selection of the dynamic range. For a microphone sensitivity of 50mV/Pa. - Low Range: 25 to 119 dBA - High Range: 37-130 dBA <u>Concerto</u> : the input 1 and 2 have two range settings (Low or High) while inputs 3 and 4 have a single fixed range (Low). <u>Alto and Conductor</u> : only the low range is available.
Sensitivity 50.0 mV/Pa	The sensor sensitivity can be entered manually or the Calibration interface can be used (see section 5.3.1.1, p.39).
dBref 2E-5	The dB reference is the unit reference from which the decibel (dB) is calculated.

Level Measurement Setup

Volume 50%	When an internal generator is used, the volume can be adjusted from 0 to 100%.
Period 20 sec	The average period of the two types of level measurement can be adjusted independently.
Type Leq ↓ ✓ Leq L99% L95% L90% L50%	The average type of the two types of measurement can be adjusted independently. It can be adjusted to be a plain average (Leq) or a statistic level (Lx%). Using the statistics instead of the Leq can minimize the punctual noise events that may occur during a measurement (especially for the background noise).
Y-axis range Y min Y max 20 90	The Y min and Y max parameters set the vertical scale (levels in dB) of the spectrum graphs of the current module.

Reverberation Measurement Setup

Source Type External ↓ PinkNoise WhiteNoise	The unit is used to generate a pink noise or a white noise. The output signal is balanced on output 1 and output 2.
Volume 100%	The volume of the internal generator can be adjusted from 0 to 100%.
Measurement Length 2,0 sec	The measurement length is the duration of the noise emission of one iteration of the reverberation evaluation.
Number of Average 5	The number of average is the number of iterations used for the reverberation evaluation.

5.3.1.1 Sensor Calibration

The input sensitivity can be calibrated using the calibration function and a sensor calibrator. Click the **Calibrate** button on the Setup interface to launch the Calibration interface.

Step 1 Adjust the calibration parameters

The defaults values are:

- Averaging time: 5 s
- Frequency: 1 kHz
- Calibrator Level: 94 dB

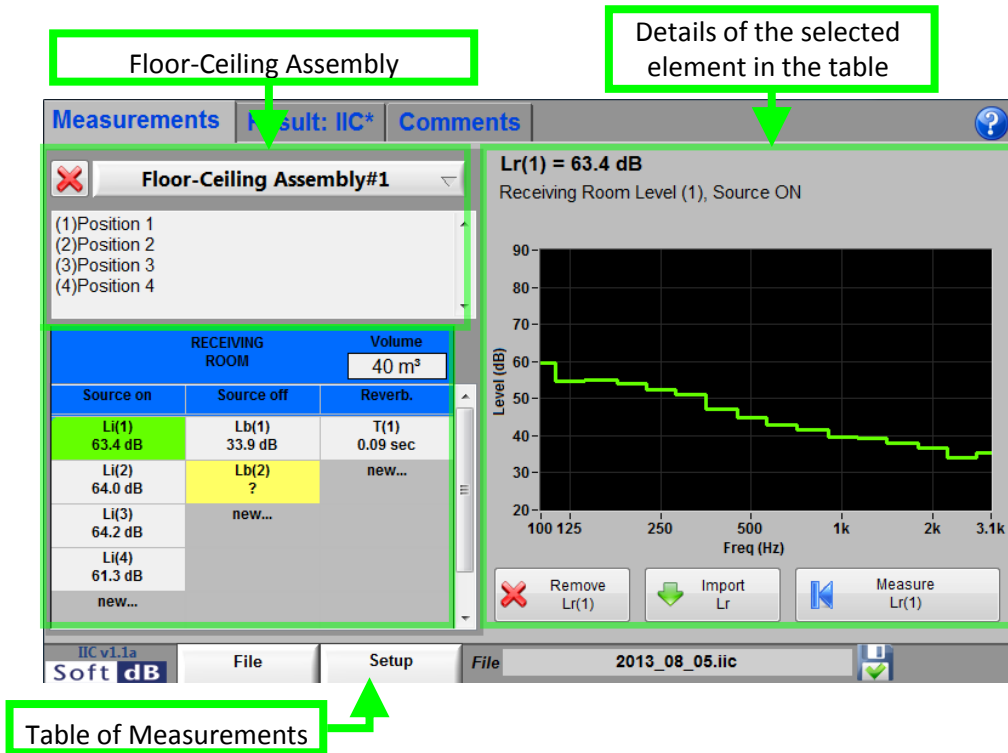

Step 2 Install the calibrator device on the microphone

Step 3 Click START

After the average time is elapsed, the sensitivity value will update.

Step 4 Click OK to accept the sensitivity value

5.4 IIC Measurements tab

The Measurements tab can be divided in three parts. The Floor-Ceiling Assembly information is in upper left corner. Just under is the table of measurements. Finally, the details of the selected element are on the right side.

Measurements controls

	<p>The Floor-Ceiling Assembly menu let you select the partition to measure.</p> <p>To add a new partition, select the last element (“new...”) of the menu ring.</p> <p>To delete a partition, select the partition and press the button</p>
	<p>The volume (m³) of the receiving room.</p>
	<p>The partition description let the user enter some basic information on the partition being qualified.</p>
	<p>If an element of the table is selected, the measurement interface will be called (see the following subsections).</p>

	Click this button to delete the selected table element.
	The import feature allows the user to load one column of data (one of the 3 data types) from another partition of the same file. It is then possible to avoid repeating the same measurements when several partitions share data with each other.

Table of Measurements

RECEIVING ROOM		Volume
		40 m ³
Tapping on	Tapping off	Reverb.
Li(1) 63.4 dB	Lb(1) 33.9 dB	T(1) 0.09 sec
Li(2) 64.0 dB	Lb(2) ?	new...
Li(3) 64.2 dB	new...	
Li(4) 61.3 dB		
new...		

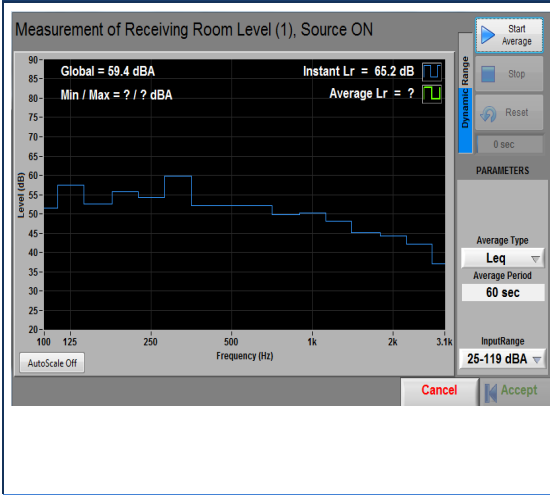

Receiving room Level measure Tapping on	Receiving room Level measure Tapping off	Receiving room Reverberation
---	--	---------------------------------

The measurement table contains four columns for the four types of measurement:

- Receiving room, level measurement, source on
- Receiving room, level measurement, source off
- Receiving room, reverberation time measurement

Several measurements can be done for each of the four types. To add a new element in the table, simply press on “new...” in the proper column. The average value of those measurements will later be used in the IIC evaluation. To see the average from the measurement tab, click on the header element above the first measurement element of a column.

Details of the selected element in the table

Name and global level of the selected element.

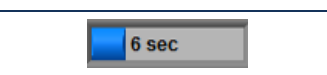

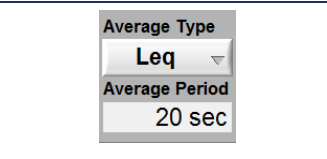

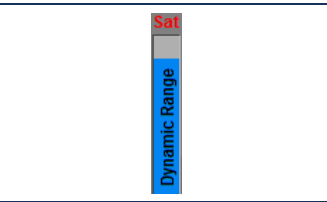

Description of the selected element

Spectrum graph of the selected element in the table.

5.4.1 Level Measurement Interface

Level Measurement controls

	<p>The Start/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process</p>
	<p>The Reset button restarts the average measurement.</p>
	<p>Progress bar of the average time.</p>
	<p>The average parameters of Average type and Average Period can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 5.3, p.37)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>
	<p>Once the measurement is acceptable, press the Accept button to return to the main interface.</p>

5.4.2 Reverberation Measurement Interface

Figure 8: Reverberation Measurement Interface

Reverberation Measurement controls

	<p>The Run/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process.</p>
	<p>The upper progress bar is the progression of the current iteration. The bottom progress bar is the progression of the iterations relative to the requested "Nbr Averages".</p>
	<p>This indicator displays which reverberation indexes are met (i.e. if T10 is on, it means that T10 was reached for every frequency bands and global).</p>
	<p>The reverberation parameters can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 5.3, p.37)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>

Once the measurement is acceptable, press the Accept button to return to the main interface.

5.4.2.1 Reverberation: Time Decay

This display shows the response to a noise interruption. It also superimposes the curves used to evaluate the reverberation time values and the averaged successive responses.

Figure 9: Time Decay tab of the reverberation

Time Decay Graph	This graph displays the time decay curves for the selected frequency band or global.								
	These buttons are used to select the visible curves on the time decay graph. T10 , T20 and T30 are the straight lines used to determine the reverberation times. All shows all the iterations in the averaging process.								
	These buttons are used to display the next or previous frequency band on the time decay graph and in the results.								
	This button is used to switch between frequency bands and global.								
<table border="1" data-bbox="219 1585 487 1638"> <thead> <tr> <th>Freq</th> <th>T10</th> <th>T20</th> <th>T30</th> </tr> </thead> <tbody> <tr> <td>100</td> <td>0,20 s</td> <td>0,21 s</td> <td>0,23 s</td> </tr> </tbody> </table>	Freq	T10	T20	T30	100	0,20 s	0,21 s	0,23 s	This array displays the computed results for the selected frequency band or global.
Freq	T10	T20	T30						
100	0,20 s	0,21 s	0,23 s						

5.4.2.2 Reverberation: Spectrum

This display shows a selected result for each frequency band and global using a bar graph. To select a frequency or the global, simply click the corresponding bar.

	<p>These buttons are used to select the result to display on the spectrum graph and Global Bar.</p>
	<p>This indicator displays the selected result for the global.</p>
	<p>This array displays the computed results for the selected frequency band or global. To select a frequency band, click on the spectrum at the desired frequency to move the cursor. To select the global, click on the global bar.</p>

5.4.2.3 Reverberation: Data

This display shows all data for all frequency bands and global in a table form.

Freq	T10	T20	T30
100	0,36 s	0,30 s	NaN s
125	0,32 s	0,45 s	NaN s
160	0,20 s	0,23 s	0,39 s
200	0,51 s	0,35 s	0,30 s
250	0,25 s	0,28 s	0,25 s

5.5 IIC Result tab

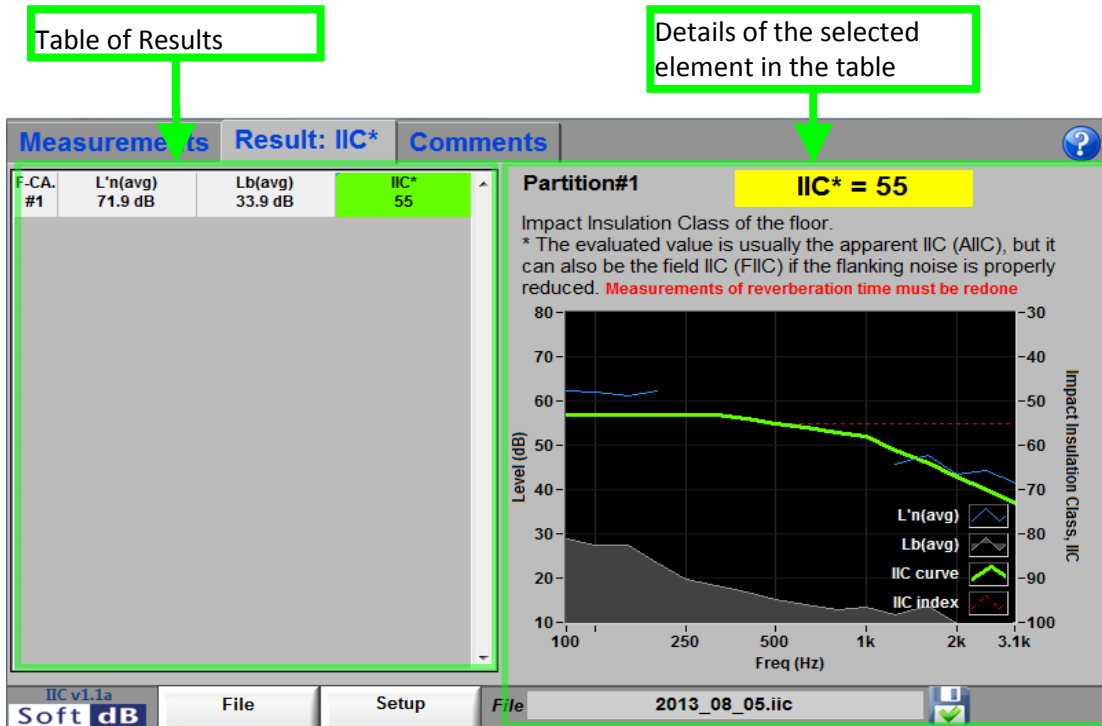

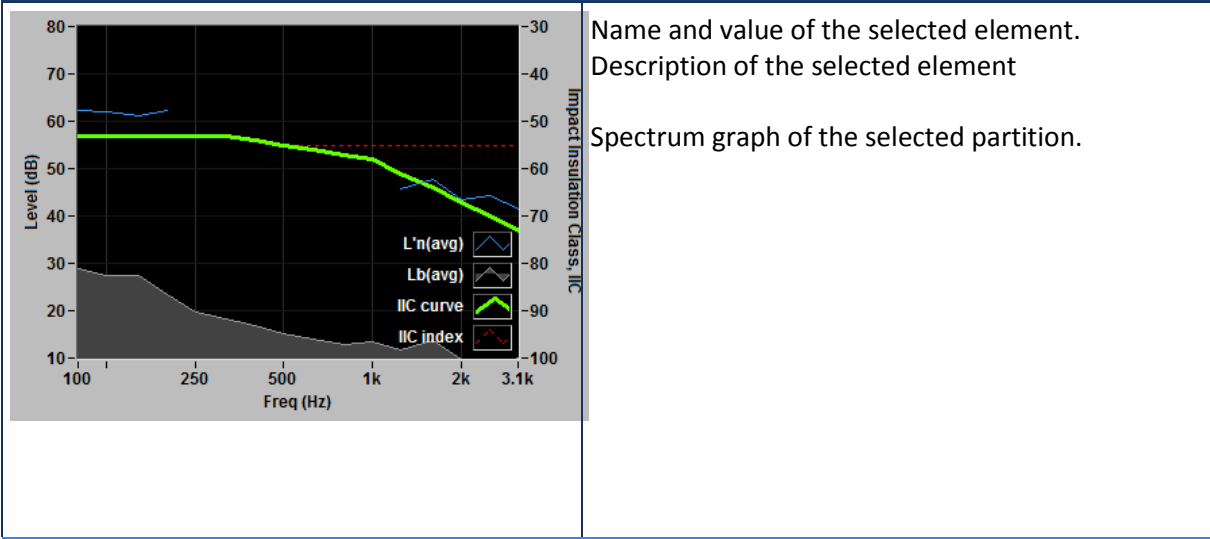

Figure 10: Result tab

The Result tab of the main interface contains the table of result (left side) and the details (right side). The table is expendable vertically as partitions are added (in the Measurements tab). Therefore, each line of the table gives the result of one partition.

Table of Results

F-CA. #1	Partition index.
L'n(avg) 71.9 dB	Average level in the source room while the source is turned on.
Lb(avg) 33.9 dB	Average background level in the receiving room while the source is turned off
IIC* 55	Impact Insulation Class. This IIC value is usually the apparent IIC (AIIIC), but can also be the field IIC (FIIC) if the flanking noise is properly reduced.

Details of the selected element in the table

5.6 IIC Comments tab

The Comments tab on the main panel can be used as a general note pad that will be saved along with the measurement data.

6 Room Noise module

General Specifications

Standards	ANSI/ASA S12.2-2008 Standard provides three primary methods for evaluating room noise: a survey method that employs the A-weighted sound level; an engineering method that employs expanded noise criteria (NC) curves; and a method for evaluating low-frequency fluctuating noise using room noise criterion (RNC) curves.
Software Features	<ul style="list-style-type: none">• Intuitive interface for NC /NR /RC measurement• Multiple room in the same file• Save, load and export measurement files

6.1 Room Noise Quick Start

The Room Noise module is part of the Building Acoustic. It can be accessed in the Building Acoustic menu of the Opus Suite panel.

Measurement tab

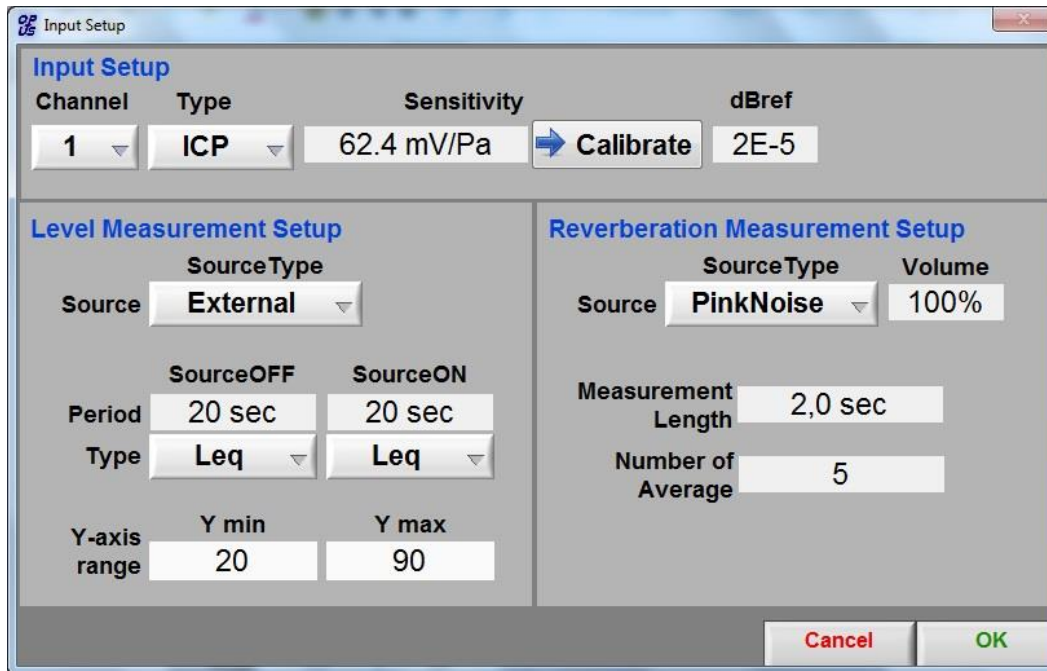

The screenshot shows the NC-NR-RC software interface. The main window displays a table of measurements under the 'Measurements' tab. The table has columns for 'Room#1', 'Background Noise Level', and 'Lb(1)'. The first row is highlighted in green, showing 'Lb(1) = 57.8 dB'. To the right of the table is a graph showing 'Level (dB)' vs 'Freq (Hz)'. Below the graph are buttons for 'Remove Lb(1)', 'Import Lb', and 'Measure Lb(1)'. A green callout box points to the table with the text 'Elements to measure'. Another green callout box points to the 'Measure Lb(1)' button with the text 'Measure the selected element'.

Room#1	Background Noise Level	Lb(1)
Mesure statique à mon bureau	Lb(1)	57.8 dB
		new...

What you should know...

- You need only one measurement: 1 background level in the receiving room.
- The main interface let do an unlimited quantity of measurements for every type of data.
- Select the corresponding column header to see the average of the different measurements of a type of data.
- The selected element of the table shows a **green background**. The details of the selection are displayed on the right side of the table.
- The elements still to measure display a question mark (?) as a value and have a **yellow background**.

Step 1 Setup the unit

Setup

Click on the **Setup** button to access the setup interface. The parameter should typically be set as shown on figure above.

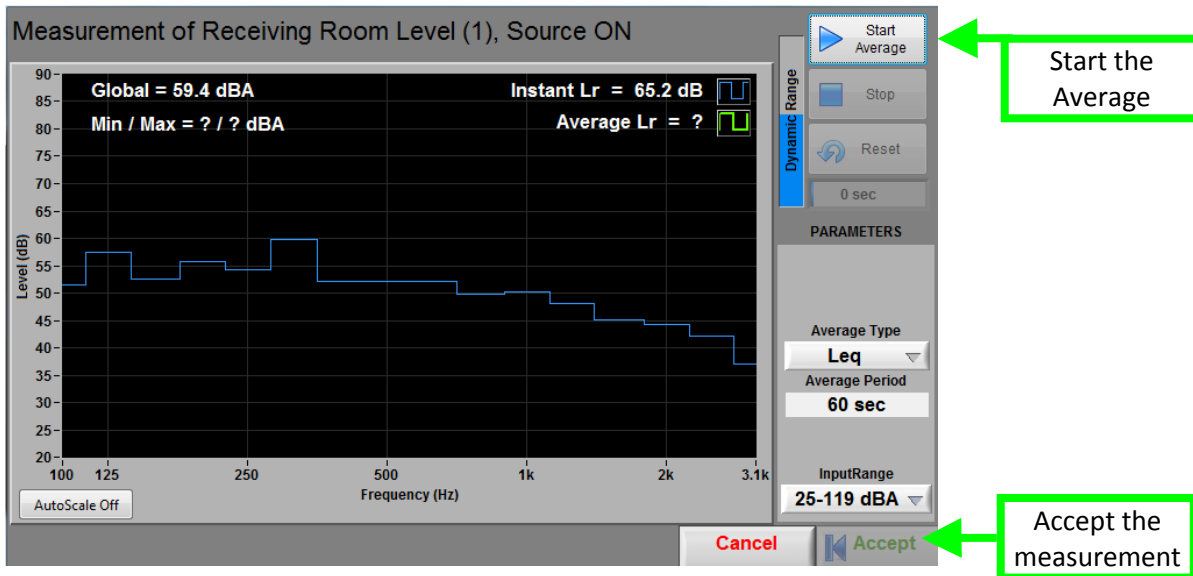

Before a measurement, the operator should set the sensitivity of the sensor used. This sensitivity can be set manually if it is known. Preferably, the sensor sensibility should be set by using the software calibration tool and a calibrator. To do so, click on **Calibrate** and follow the instructions of the Sensor Calibration (section 6.3.1, p.60).

The level measurement can be made using an external generator or the internal generator (pink or white noise).

OK

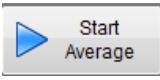

Click **OK** to return to the main panel.

Step 2 Do a Level Measurement

To proceed to a measurement, select an element to measure in the table of the main panel and click

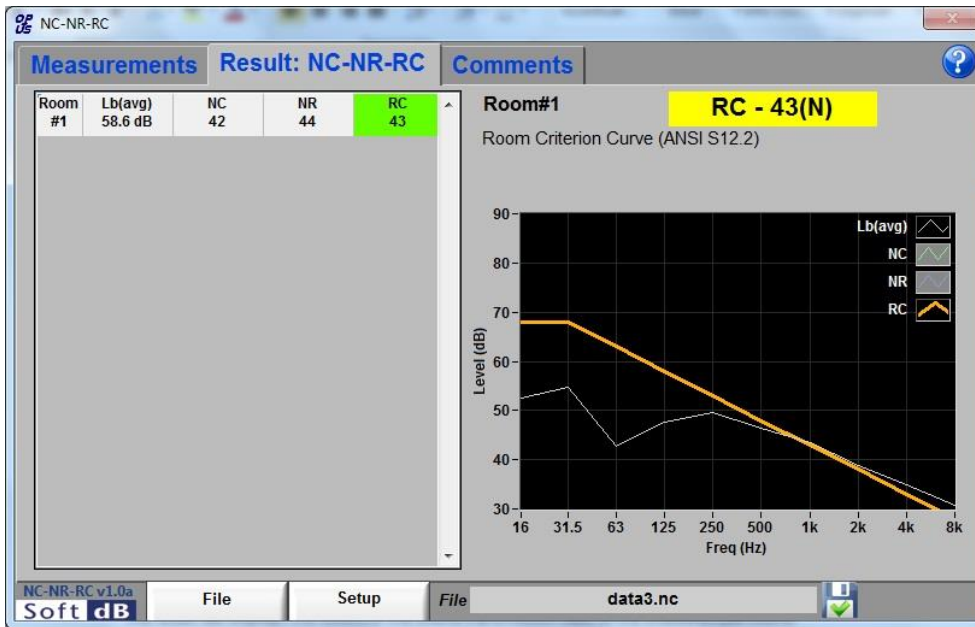

the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the average measurement. The acquisition ends by itself once the average period is reached (as set in setup) and can be stopped at any time.

Click on the  button to accept the measurement.

- Measurements must be taken at normal standing height or at a normal seated amplitude (minimum of 5' 6" high for standing measurements and at 4' 0" for seated measurements)
- The microphone must be at 2' away from any reflecting surface or 4' from the intersection of two intersecting reflecting surfaces or 8' from the intersection of three intersecting reflecting surfaces.

Step 3 Analyze the results

The result tab displays the results of the Noise Criteria, Noise Rating Curves and the Room Criteria to the evaluated the Room.

The measurements can be saved and exported through the menu of the  button.

6.2 Room Noise Main Interface

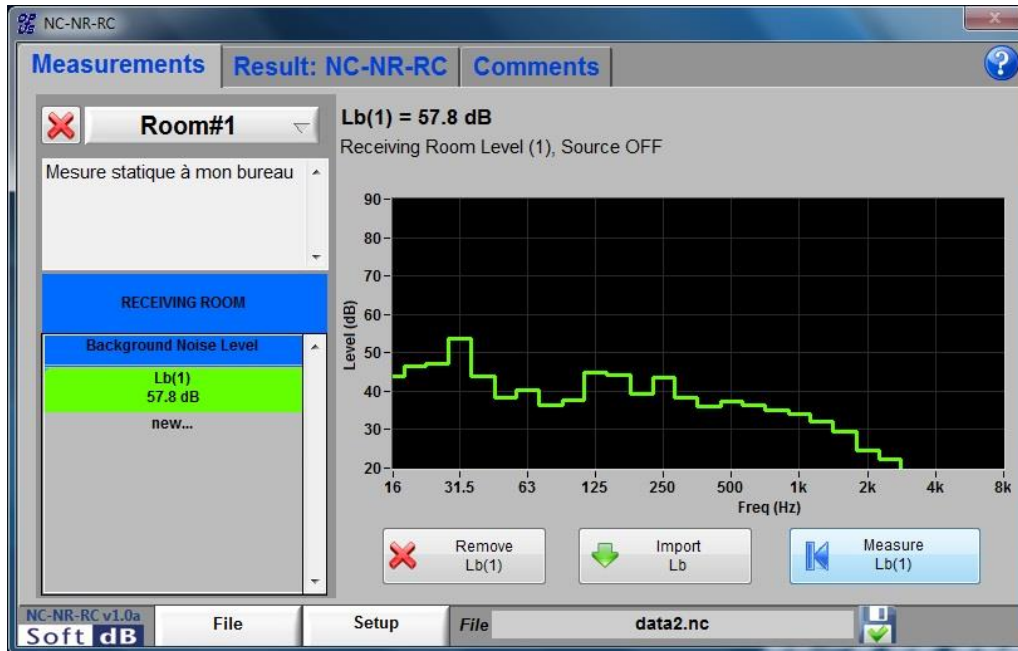

Figure 11: Main interface

Main controls and indicators

  	<p>Main interface tabs:</p> <ul style="list-style-type: none"> • Measurements tab (section 6.4, p.61) • Result tab (section 6.5, p.65) • Comments tab (section 6.6, p.66)
	<p>File Menu button (see the following table).</p>
	<p>Setup button that calls the setup interface (section 6.3, p.58).</p>
	<p>Module name and version number.</p>
	<p>File name of the measurement. A green check on the disk icon indicates that the data are saved.</p>
	<p>Click this button to display the help window. This help is a reminder of the steps and the rules to follow.</p>

6.3 Room Noise Setup Interface

Figure 12: Setup interface

Input Setup

Channel 1	The input channel used for the measurements
Type ICP	The available input types are AC and ICP sensors.
Range 25-119 dBA	Selection of the dynamic range. For a microphone sensitivity of 50mV/Pa. - Low Range: 25 to 119 dBA - High Range: 37-130 dBA <u>Concerto</u> : the input 1 and 2 have two range settings (Low or High) while inputs 3 and 4 have a single fixed range (Low). <u>Alto and Conductor</u> : only the low range is available.
Sensitivity 50.0 mV/Pa	The sensor sensitivity can be entered manually or the Calibration interface can be used (see section 6.3.1, p.60).
dBref 2E-5	The dB reference is the unit reference from which the decibel (dB) is calculated.

Level Measurement Setup

Volume 50%	When an internal generator is used, the volume can be adjusted from 0 to 100%.
Period 20 sec	The average period of the two types of level measurement can be adjusted independently.
Type Leq ↓ ✓ Leq L99% L95% L90% L50%	The average type of the two types of measurement can be adjusted independently. It can be adjusted to be a plain average (Leq) or a statistic level (Lx%). Using the statistics instead of the Leq can minimize the punctual noise events that may occur during a measurement (especially for the background noise).
Y-axis range Y min Y max 20 90	The Y min and Y max parameters set the vertical scale (levels in dB) of the spectrum graphs of the current module.

Reverberation Measurement Setup

Source Type External ↓ PinkNoise WhiteNoise	The unit is used to generate a pink noise or a white noise. The output signal is balanced on output 1 and output 2.
Volume 100%	The volume of the internal generator can be adjusted from 0 to 100%.
Measurement Length 2,0 sec	The measurement length is the duration of the noise emission of one iteration of the reverberation evaluation.
Number of Average 5	The number of average is the number of iterations used for the reverberation evaluation.

The Reverberation Measurement Setup should not be useful for NC / NR / RC measurements.

6.3.1 Sensor Calibration

The input sensitivity can be calibrated using the calibration function and a sensor calibrator. Click the **Calibrate** button on the Setup interface to launch the Calibration interface.

Step 4 Adjust the calibration parameters

The defaults values are:

- Averaging time: 5 s
- Frequency: 1 kHz
- Calibrator Level: 94 dB

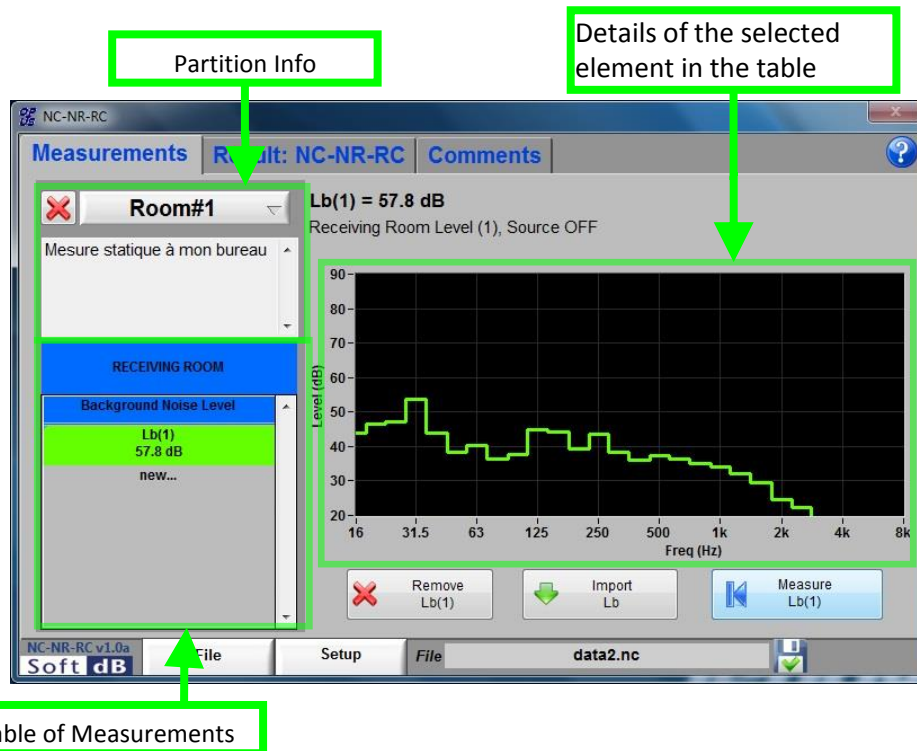

Step 5 Install the calibrator device on the microphone

Step 6 Click START

After the average time is elapsed, the sensitivity value will update.

Step 7 Click OK to accept the sensitivity value

6.4 Room Noise Measurements tab

The Measurements tab can be divided in three parts. The room information is in upper left corner. Just under is the table of measurements. Finally, the details of the selected element are on the right side.

Measurements controls

	<p>The room menu let you select the partition to measure. To add a new room, select the last element ("new...") of the menu ring. To delete a room, select the partition and press the  button</p>

	<p>If an element of the table is selected, the measurement interface will be called (see the following subsections).</p>
	<p>Click this button to delete the selected table element.</p>
	<p>The import feature allows the user to load one column of data from another partition of the same file. It is then possible to avoid repeating the same measurements when several rooms share data with each other.</p>

Table of Measurements

To add a new element in the table, simply press on “new...” in the proper column. The average value of those measurements will later be used in the NC/NR/RC evaluation. To see the average from the measurement tab, click on the header element above the first measurement element of a column.

Details of the selected element in the table

	<p>Name and global level of the selected element.</p> <p>Description of the selected element</p> <p>Spectrum graph of the selected element in the table.</p>
--	--

6.4.1 Level Measurement Interface

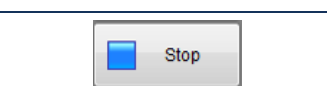

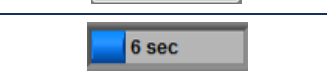

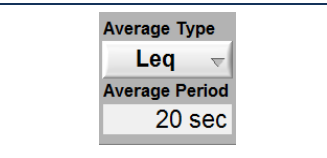

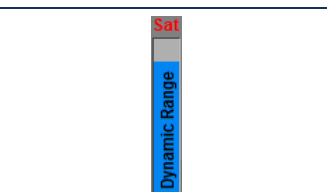

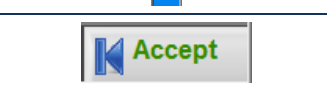

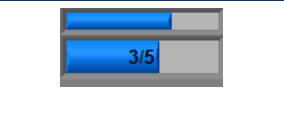

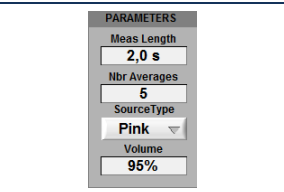

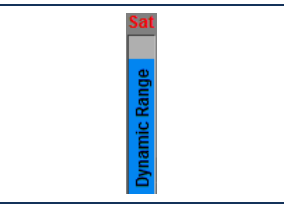

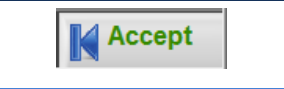

Figure 13: Reverberation Measurement Interface

Level Measurement controls

	<p>The Start/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process</p>
	<p>The Reset button restarts the average measurement.</p>
	<p>Progress bar of the average time.</p>
	<p>The average parameters of Average type and Average Period can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 6.3, p.58)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>
	<p>Once the measurement is acceptable, press the Accept button to return to the main interface.</p>

Reverberation Measurement controls

	<p>The Run/Pause button starts/pauses the average measurements. The measurement will stop by itself at the end of the average period.</p>
	<p>The Stop button stops the average process.</p>
	<p>The upper progress bar is the progression of the current iteration. The bottom progress bar is the progression of the iterations relative to the requested "Nbr Averages".</p>
	<p>This indicator displays which reverberation indexes are met (i.e. if T10 is on, it means that T10 was reached for every frequency bands and global).</p>
	<p>The reverberation parameters can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 6.3, p.58)</p>
	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>
	<p>Once the measurement is acceptable, press the Accept button to return to the main interface.</p>

6.5 Room Noise Result tab

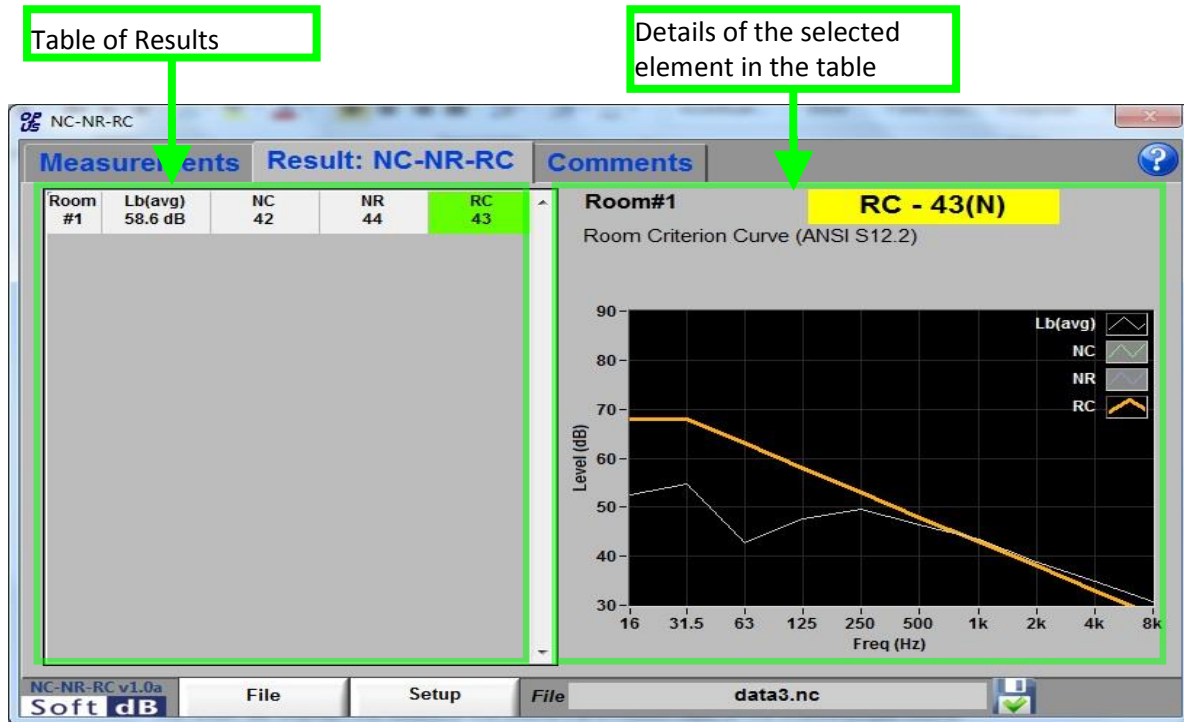

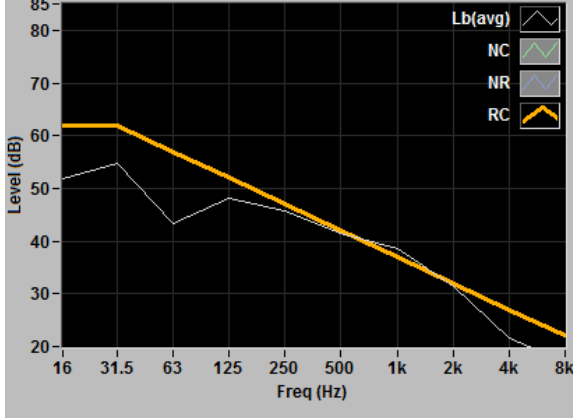

Figure 14: Result tab

The Result tab of the main interface contains the table of result (left side) and the details (right side). The table is expandable vertically as partitions are added (in the Measurements tab). Therefore, each line of the table gives the result of one room.

Table of Results

Room #1	Room index.
Lb(avg) 57.8 dB	Average background level in the receiving room while the source is turned off.
NC 37	Noise Criteria Index.
NR 39	Noise Rating Curves Index.
RC 37	Room criteria curves.

Details of the selected element in the table

<p>Room#1 RC - 37(N)</p> <p>Room Criterion Curve (ANSI S12.2)</p>  <p>Level (dB)</p> <p>Freq (Hz)</p> <p>Lb(avg)</p> <p>NC</p> <p>NR</p> <p>RC</p>	<p>Name and value of the selected element.</p> <p>Description of the selected element</p> <p>Spectrum graph of the selected room.</p>
--	---

6.6 COMMENTS tab

Comments

Enter general description here

The Comments tab on the main panel can be used as a general note pad that will be saved along with the measurement data.

7 RT-60 module

General Specifications – RT-60 Module

Measurement modes	<ul style="list-style-type: none"> • Automatic interrupted noise mode with built-in noise generator • Automatic Schroeder mode using impulse response reconstruction • Manual interrupted noise mode using auto-detection of an external noise source interruption • Manual impulse mode using auto-detection of an impulse noise
Spectrum Bands	<ul style="list-style-type: none"> • 1/1 Octave bands (125 Hz to 4 kHz) • 1/3 Octave bands (100 Hz to 5 kHz) • Global
Available Results	<ul style="list-style-type: none"> • T10 • T20 • T30 • Early Decay Time (EDT) • Dynamic • Clarity (C80)¹ • Central Time (Ts)* • Definition (D50)*

¹ Only available with the automatic Schroeder method

7.1 RT-60 Quick Start

Step 1 *Select Measure Mode*

Click on the  button to select the measure mode from the menu. The measure modes are:

For purposes of example, select **Manual Impulse** from the menu. This mode does not require a sound source and can be performed simply by clapping hands.

Step 2 *Start the Measurement*

Click on the  button to start the measurement. Follow the instructions in the status bar at the top of the main interface.

- 1 
- 2 
- 3 ***You can now clap your hands***
- 4 
- 5 
- 6 

Once the measurement process is complete, click on the  button to stop the measurement.

Step 3 *Save the Measurement*

Click on the  button to save the measurement. The measurement file will be saved as a .rt6 file in the file save directory. Its name will appear as a four digit number displayed in the File info section of the main interface.

Step 4 *Visualize the Measurement*

Click on the  button to select the display from the menu. The available displays are:

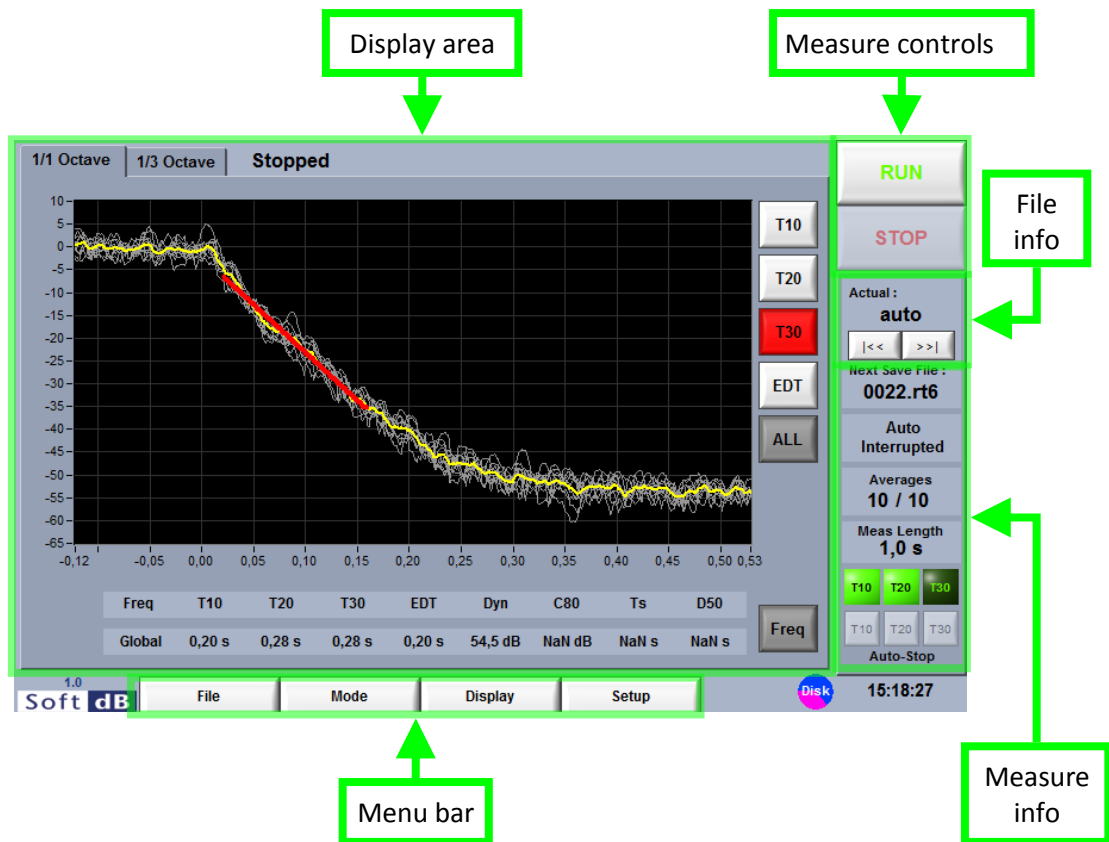

Decay	This display shows the time decay for a given frequency band or for the global.
Spectrum	This display shows a selected value from each frequency band in a bar graph form.
Data	This display shows all values for all frequency bands in an array.

Further information about each display is available in section 7.2.5, p. 73.

7.2 RT-60 Main Interface

The main interface is divided into five sections:

- 1) Measure controls (see section 7.2.1, p. 71)
- 2) File info (see section 7.2.2, p. 71)
- 3) Measure info (see section 7.2.3, p. 71)
- 4) Menu bar (see section 7.2.4, p. 72)
- 5) Display area (see section 7.2.5, p. 73)

The following operations can be performed using the main interface:

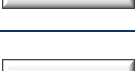

- Perform a measurement according to the current measure mode
- Modify the setup using the **Setup** menu
- Save, Export and Open data using the **File** menu

7.2.1 Measure Controls

RUN/PAUSE/CONTINUE (Automatic mode)

	When the user clicks this button, the measurement process is launched. The RUN button then automatically becomes the PAUSE button.
	When the user clicks this button, the measurement process is suspended. The PAUSE button then automatically becomes the CONTINUE button.
	When the user clicks this button, the measurement process continues from where it was suspended. The CONTINUE button then automatically becomes the PAUSE button.

RUN/ADD (Manual mode)

	When clicked, this button starts the measurement. This button is then disabled until an average iteration is complete. When an average iteration is complete, this button becomes the ADD button.
	This button is displayed and enabled while the manual measurement process is waiting for another average iteration. When the user clicks this button, another average iteration is launched. This button is then disabled until the average iteration is complete.

STOP/SAVE

	When the user clicks this button, the measurement stops. The STOP button then becomes the SAVE button.
	When the user clicks this button, the active measurement is saved. The SAVE button is then disabled until another measurement is complete.

7.2.2 File Info

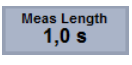

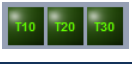

File Save

	This indicator displays the current measurement file.
	These two buttons are used to open the next and previous files (respectively) in the measurement save directory.
	This indicator displays the next file to be saved.

7.2.3 Measure Info

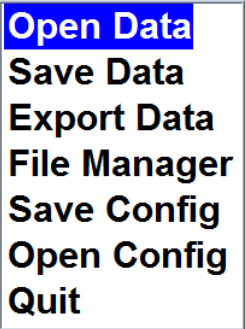

Measure Info

	This indicator displays the current measure mode. Clicking on this indicator launches the setup interface, which allows the user to select a different measure mode.
	This indicator displays the current average iteration and the specified average number. Clicking on this indicator launches the setup interface where the average number can be changed.

	<p>This indicator displays the specified measure length. Clicking on this indicator launches the setup interface where the measure length can be changed.</p>
	<p>This indicator displays which reverberation indexes are met (i.e. if T10 is light on, it means that T10 was reached for every frequency bands and global).</p>
	<p>This control allows the software to automatically stop a measurement once the specified reverberation index is met. This control is only available in automatic Schroeder mode.</p>

7.2.4 Menu Bar

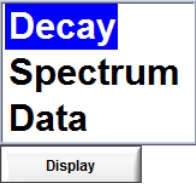

File Menu

	Open Data:	This item allows the user to open a measurement file (.rt6).
	Save Data:	This item allows the user to save a measurement file (.rt6). When the user saves a measurement, its file number is automatically generated and saved in the measurement save directory.
	Export Data:	This item allows the user to export the data in a tab delimited file (.txt .xls).
	File Manager:	This item launches the File manager (see section 11, p. 124)
	Save Config:	This item allows the user to save the software interface configuration in a .cfg file.
	Open Config:	This item allows the user to open a .cfg file to restore the saved interface configuration.
	Quit:	This item allows the user to quit the RT-60 module and return to the Opus Suite interface.

Mode Menu

	Auto Interrupted:	Changes software configuration to automatic interrupted noise mode (section 7.4.1, p. 78).
	Auto Schroeder:	Changes software configuration to automatic Schroeder mode (section 7.4.2, p. 79).
	Manual Interrupted:	Changes software configuration to manual interrupted noise mode (section 7.4.3, p. 80).
	Manual Impulse:	Changes software configuration to manual impulse mode (section, 7.4.4 p. 82).

Display Menu

	Decay:	This item sets the interface to display the time decay for a specified frequency band or global.
	Spectrum:	This item sets the interface to display a specified reverberation index for all frequency bands and global on a bar graph.
	Data:	This item sets the interface to display all the reverberation indexes for all frequency bands and global in an array.

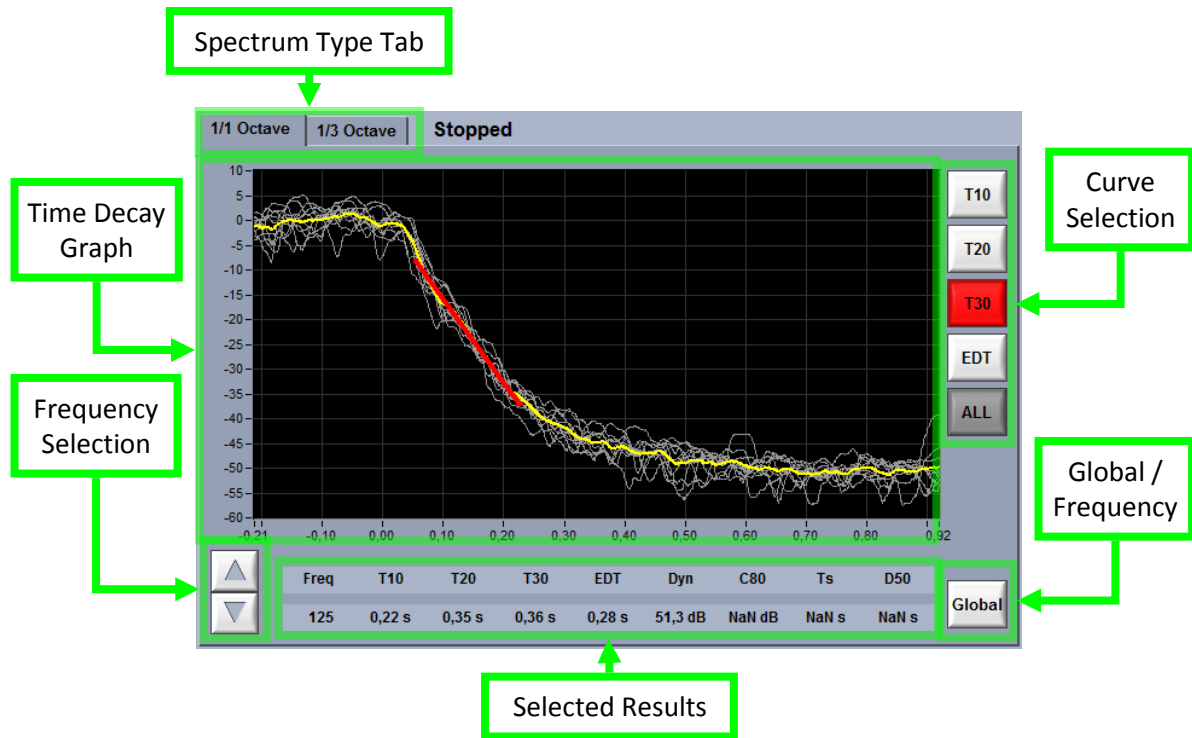

7.2.5 Display Area

Data can be presented using one of three available displays:

- Decay (see section 7.2.5.1, p. 74)
- Spectrum (see section 7.2.5.2, p. 75)
- Data (see section 7.2.5.3 p.76)

7.2.5.1 Decay

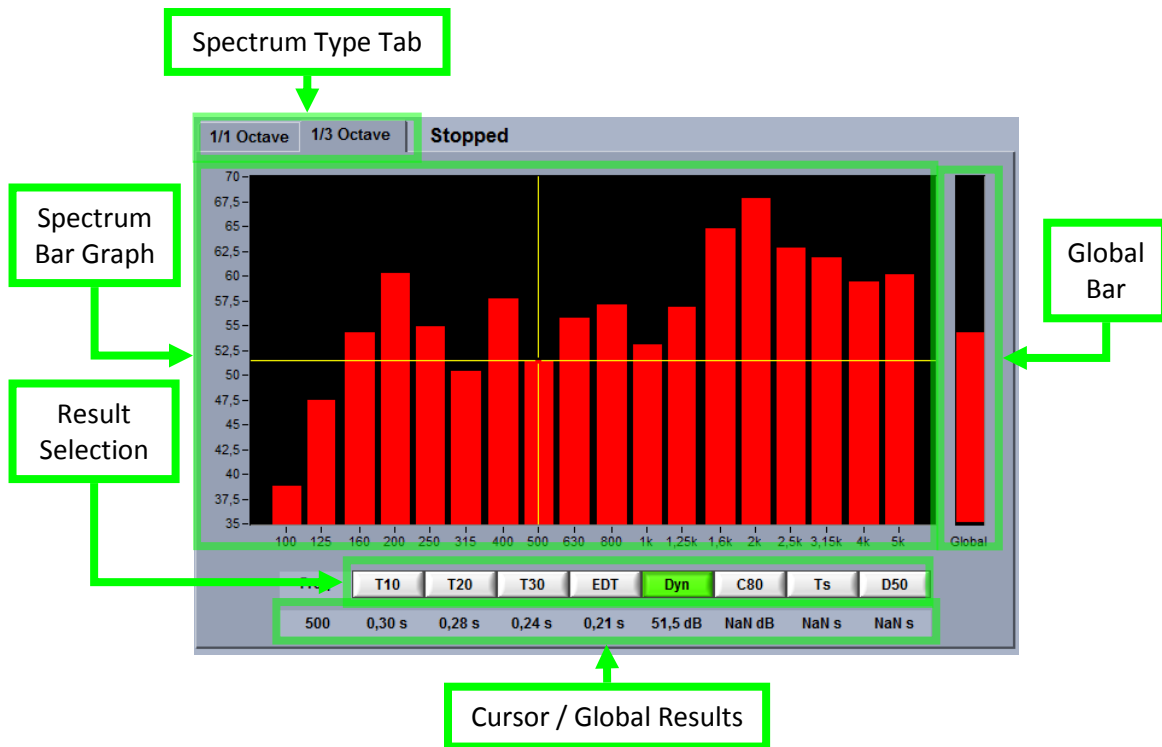

This display shows the response to a noise interruption or impulse. It also superimposes the curves used to evaluate RT values and the averaged successive responses.

Spectrum Type Tab	This tab switches between 1/1 octave bands 1/3 octave bands results.
Time Decay Graph	This graph displays the time decay curves for the selected frequency band or global.
Frequency Selection	These buttons are used to display the next or previous frequency band on the time decay graph and in the results (Selected Results).
Curve Selection	These buttons are used to select the visible curves on the time decay graph. T10 , T20 and T30 are the straight lines used to determine the reverberation times. EDT is the straight line used to determine the Early Decay Time. All shows all the iterations in the averaging process (unavailable in Auto Schroeder mode).
Global / Frequency	This button is used to switch between frequency bands and global.
Selected Results	This array displays the computed results for the selected frequency band or global.

7.2.5.2 Spectrum

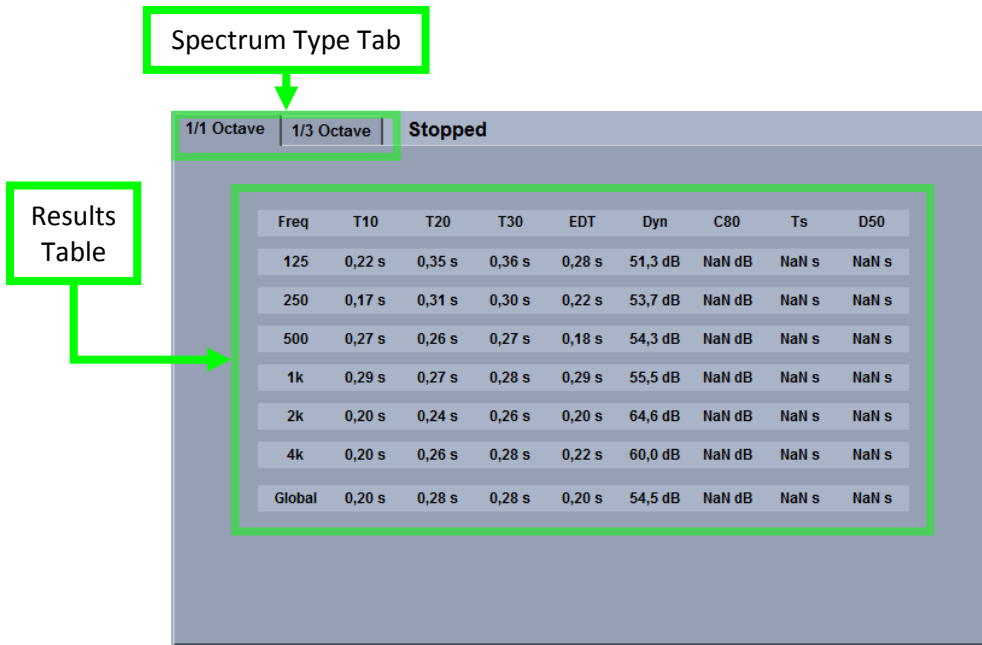

This display shows a selected result for each frequency band and global using a bar graph.

Spectrum Type Tab	This tab switches between 1/1 octave bands 1/3 octave bands results.
Spectrum Bar Graph	This graph displays the selected result for every frequency band.
Result Selection	These buttons are used to select the result to display on the spectrum graph and Global Bar.
Global Bar	This indicator displays the selected result for the global.
Cursor/Global Results	This array displays the computed results for the selected frequency band or global. To select a frequency band, click on the spectrum at the desired frequency to move the cursor. To select the global, click on the global bar.

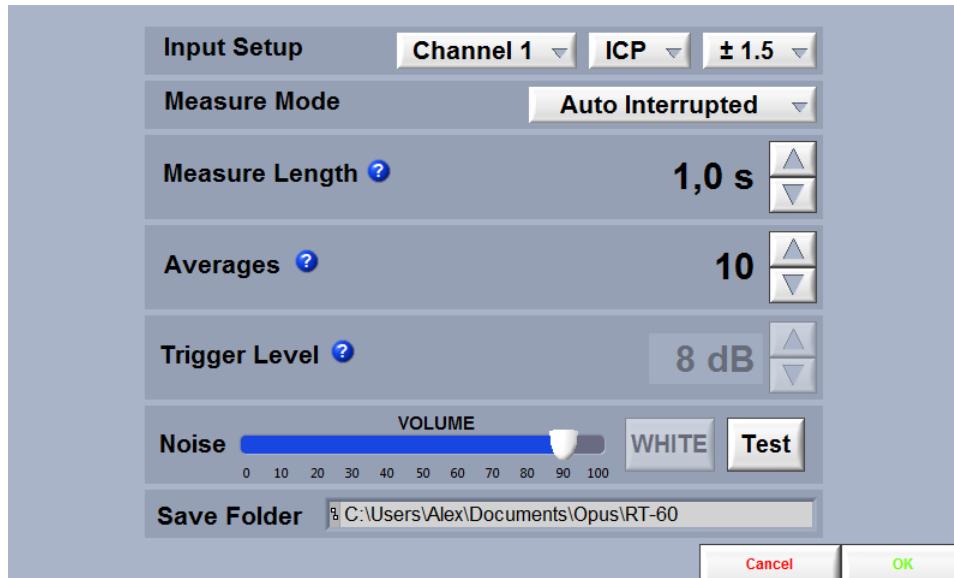

7.2.5.3 Data

This display shows all data for all frequency bands and global in a table form.

Spectrum Type Tab	This tab switches between 1/1 octave bands 1/3 octave bands results.
Results Table	This array displays all available results for every frequency band and global.

7.3 RT-60 Setup

Input Setup	These controls allow selecting the input channel, the input type and the input range from drop down lists.
Measure Mode	This drop down list is used to select the measure mode.
Measure Length	This control is used to select the measure length in automatic mode. In manual mode, this control is unavailable.
Averages	This control is used to select the number of averages to perform. This control is unavailable in automatic Schroeder mode.
Trigger Level	This control is used to select the trigger level used to detect a noise interruption or an impulse in manual mode.
Noise	These controls are used to select the noise generator volume and noise type (pink/white). A test button is used to momentarily generate noise in order to set these parameters.
Save Folder	This indicator displays the measurement save directory. Clicking on this indicator displays a dialog window to browse for a new location.

7.4 RT-60 Measurement modes tutorials

7.4.1 Automatic Interrupted Noise

This method evaluates the reverberation time by analysing the noise level decay occurring after a noise interruption. The noise interruptions are automatically generated using the internal noise generator. The result is a highly reproducible measurement that produces high precision results and allows a large number of averages.

Step 1 Noise Source Set-Up

Connect the **Concerto** output to the noise source using the appropriate cable.

Step 2 Software Set-Up

- 1) Click the  button on the menu bar to access the setup interface.
- 2) Select **channel 1, ICP** input and **±1,5V** on the **Input Setup**
- 3) Select **Auto Interrupted** on the **Measurement mode** drop down list.
- 4) Select the appropriate **Measure Length²** for the room under test.
- 5) Select the number of **Averages** you want to perform.
- 6) Select the appropriate **Noise Volume** and click on **Test** to hear a sample of this sound level.
- 7) Click **OK** to return to the main interface.

Step 3 Running the Measurement

Click the  button to launch the measurement process.

The noise should turn on and off at regular intervals. Between each interval, the time decay curves are processed and averaged. Evaluated results will be displayed. While the measurement is running, the display mode can be modified to view to view different aspects of the measurement in progress.

If the selected **measure length** is below the measured $T20$, the **measure length indicator**  will be coloured in red. When this occurs, it is recommended to resume the measurement with a longer measure length.

² The measure length in the auto interrupted method is the noise on and off time. This duration must be as long as the expected $T20$ of a room (i.e. in a room with a $T20$ of 0.5 s the measurement must be executed using a measure length of at least 0.5 s)

Step 4 Stopping the Measurement

The measurement stops when the specified number of **Averages** has been completed. However, the user can stop the measurement process any time by clicking the  button.

Step 5 Saving the Measurement

The measurement is saved by clicking the  button. When done, the current file indicator  will display the current file name.

7.4.2 Automatic Schroeder

This method evaluates the reverberation time by performing an impulse response reconstruction by analysing the transfer function of a particular room. In addition to the reverberation time, it also computes the C80, Ts and D50 results which are unavailable in the other methods.

This method is achieved by performing the FRF on the input and output signals. As the signal blocks are processed, the reconstructed impulse response converges and measure dynamic increases.

Step 1 Noise Source Set-Up

Connect the **Concerto** output to the noise source using the appropriate cable.

Step 2 Software Set-Up

- 1) Click the  button on the menu bar to access the setup interface.
- 2) Select **channel 1, ICP** input and **±1,5V** on the **Input Setup**
- 3) Select **Auto Schroeder** on the **Measurement mode** drop down list.
- 4) Select the appropriate **Measure Length**³ for the room under test.
- 5) Select the appropriate **Noise Volume** and click on **Test** to hear a sample of this sound level.
- 6) Click **OK** to return to the main interface.

³ The measure length in the Auto Schroeder mode must be as long as the expected T20 of a room (i.e. in a room with a T20 of 0.5 s the measurement must be executed using a measure length of at least 0.5 s) This length is used to select the appropriate signal block length on which to compute the FRF.

Step 3 *Running the Measurement*

Click the  button to launch the measurement process. The noise will begin and the average number should increase periodically.

You can follow the measurement process by displaying the **Dynamic** view on the **Spectrum** display. As the measurement proceeds, the dynamic should increase. Required dynamic for each reverberation time index are showed in the following table:

T10	25 dB
T20	35 dB
T30	45 dB
EDT	25 dB

Once the specified dynamic has been reached for every frequency band and global, the reached TX indicator  should light up.

Step 4 *Stopping the Measurement*

The measurement stops when the TX specified in the auto-stop setting  has been reached.

The user can stop the measurement process any time by clicking the  button.

Step 5 *Saving the Measurement*

The measurement is saved by clicking the  button. Once complete, the current file indicator  will display the current file name.

7.4.3 Manual Interrupted Noise

This method evaluates the reverberation time by analysing the noise level time decay occurring after a noise interruption. The noise interruptions are manually generated using an external noise generator.

Step 1 *Software Set-Up*

- 1) Click the  button on the menu bar to access the setup interface.
- 2) Select **channel 1**, **ICP** input and **±1,5V** on the **Input Setup**
- 3) Select **Manual Interrupted** on the **Measure mode** drop down list.
- 4) Select the number of **Averages** you want to perform.

- 5) Select the appropriate **Trigger Level**⁴ necessary to detect the noise interruption.
- 6) Click **OK** to return to the main interface.

Step 2 *Running the Measurement*

- 1) Turn on the external noise generator and adjust the volume to the desired level.
- 2) Click the  button to launch the measurement process.
- 3) The measurement status should go through these steps:

- 1 
- 2 
- 3 ***You can now turn off the noise generator***
- 4 
- 5 
- 6 

At this point, 1 average iteration is complete and the process is waiting for another average iteration.

Step 3 *Adding More Average Iterations*

When an average iteration is finished, turn on the noise generator again and click the  button. The process should go through the same steps described in **Step 2**.

Step 4 *Stopping the Measurement*

The measurement stops when the specified **Average Number** is reached. The user can stop the measurement process at any time by clicking the  button.

Step 5 *Saving the Measurement*

The measurement is saved by clicking the  button. Once complete, the current file indicator  will display the current file name.

⁴ The trigger level is used to detect the noise interruption (i.e. if the trigger level is set to 5 dB, a noise interruption will be detected when the noise level is 5 dB lower than the activated noise level).

7.4.4 Manual Impulse

This method evaluates the reverberation time by analysing the noise level time decay occurring after an impulse. The impulses are produced manually by clapping pieces of wood together or by bursting a balloon.

Step 1 Software Set-Up

- 1) Click the  button on the menu bar to access the setup interface.
- 2) Select **channel 1, ICP** input and **±1,5V** on the **Input Setup**
- 3) Select **Manual Impulse** on the **Measurement mode** drop down list.
- 4) Select the number of **Averages** you want to perform.
- 5) Select the appropriate **Trigger Level**⁵ necessary to detect the noise interruption.
- 6) Click **OK** to return to the main interface.

Step 2 Running the Measurement

- 1) Click the  button to launch the measurement process.
- 2) The measurement status should go through following steps:

- 1 
- 2 
- 3 ***You can now generate the impulse***
- 4 
- 5 
- 6 

At this point, 1 average iteration is complete and the process is waiting for another average iteration.

Step 3 Adding More Average Iterations

When an average iteration is finished, click the  button. The process should go through the same steps described in **Step 2**.

Step 4 Stopping the Measurement

⁵ The trigger level is used to detect the impulse (i.e. if the trigger level is set to 5 dB, an impulse will be detected when the noise level is 5 dB higher than the floor noise level).

The measurement stops when the specified **Average Number** has been reached. The user can stop the measurement process any time by clicking the  button.

Step 5 Saving the Measurement

The measurement is saved by clicking the  button. When complete, the current file indicator  will display the current file name.

8 E2638 Module

General Specifications

Standard	Test Method E2638-10, by ASTM International Standard Test Method for Objective Measurement of the Speech Privacy Provided by a Closed Room. It is designed to measure the degree of speech privacy provided by a closed room, indicating the degree to which conversations occurring within are kept private from listeners outside the room
Software Features	Intuitive interface for E2638 measurement Embedded noise generator (white or pink noise) Real time 1/3 octave band spectrum (IEC 1260 Type 1) Automated calculation of the Speech Privacy Class (SPC) Expendable interface for multiple source positions and receiving points Save, load and export measurement files

8.1 E2638 Quick Start

The E2638 module (Speech Privacy provided by a Closed Room) is part of the Building Acoustics Suite. It can be accessed in the Building Acoustics menu of the Opus Suite panel (see **Erreur ! Source du renvoi introuvable.**).

Measurement tab

The screenshot displays the 'Measurements' tab in the software. It features a table with the following structure:

	Source OFF (Background)	Source ON Position s(1)
Source Room Level		Ls(1) ?
Outside		
Receiving Point r(1)	Lr(1)b ?	Lr(1)s(1) ?

Below the table, a green box labeled 'Elements to measure' points to the yellow-highlighted cells in the 'Receiving Point r(1)' row. To the right, a graph area shows 'Ls(1)(avg) = ?' and a yellow message box: 'No data yet. Please proceed to the measurement.' A 'Measure Ls(1)' button is visible at the bottom right of the graph area.

What you should know...

- The main interface let you add/remove source positions and receiving points.
- A text description can be entered for each receiving point and each source position. Click on the corresponding header in the table to display the text box.
- The selected element of the table shows a green background. The details of the selection are displayed on the right side of the table.
- The elements still to measure display a question mark (?) as a value and have a yellow background.

Step 1 Setup the unit

Input Setup	
Channel	Type
1	ICP
Range	Sensitivity
25-119 dBA	50.0 mV/Pa
Calibrate	
dBref	2E-5

Source Setup	
Source Type	Output Channel
PinkNoise	1-2 (differential)
Volume	50%
▶ Test Source	

Measurement Setup	
Average Type	Leq
Average Period	30 sec
Within Room	30 sec
At Receiver, SourceOFF	15 sec
At Receiver, SourceON	15 sec

Graph Setup	
Y-axis range	
Y min	30
Y max	100

Cancel **OK**

Click on the  button to access the setup interface. The parameter should typically be set as shown on figure above.

Before a measurement, the operator should set the sensitivity of the sensor used. This sensitivity can be set manually if it is known. Preferably, the sensor sensibility should be set by using the software calibration tool and a calibrator. To do so, click on  and follow the instructions of the Sensor Calibration (section 8.3.1, p.94).

Adjust the source output volume. The source should be loud enough to measure well above the background level at the receiving point(s).

Click  to return to the main panel.

Step 2 Do a Measurement

Measurement of Ls(1): Level within closed room, Source On at Position 1.

Global = 78.0 dBA
Global = ?

Instant Ls(1)(avg) = 68.0 dB
Average Ls(1)(avg) = ?

Level (dB)

Frequency (Hz)

Dynamic Range

Start Average

Stop

Reset

0 sec

Average Type
Leq

Average Period
30 sec

AutoScale Off

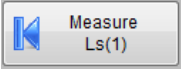

Cancel

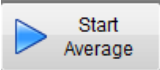

Accept

Start the Average

Accept the measurement

To proceed to a measurement, select an element to measure in the table of the main panel and click

the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the average measurement. The acquisition ends by itself once the average period is reached (as set in setup) and can be stopped at any time.

Click on the  button to accept the measurement.

You are now ready to follow the measurement procedure.

Step 3 *Select the source position(s) in the room*

- An omnidirectional loudspeaker should be used
- Positions representative of typical locations of talkers
- Positions 1.5 m above the floor
- At least 2 positions have to be tested according to the E2638-10 standard
- Positions apart at least 1.2 m from each other

If a conventional directional loudspeaker is used, the source positions should be selected in the opposite corners of the wall being used for receiving points. Additional positions will be needed to reduce the uncertainty.

Step 4 *Measure the room levels for the source position(s), source ON*

The operator should survey the room using a path that is representative of the room volume while keeping a good time distribution over the room volume.

- Microphone at least 0.5 m from the operator
- Microphone speed slow and as constant as possible
- Microphone at least 1.5 m from the sound source
- Microphone at least 1 m from the walls of the room
- The recommended average time is 30 seconds according to the E2638-10 standard

Step 5 *Select the receiving point(s) in the room*

Select receiving points outside the closed room under consideration. Consider the points near the followings:

- Doors,
- Windows
- Other weak spots
- Other location of interest

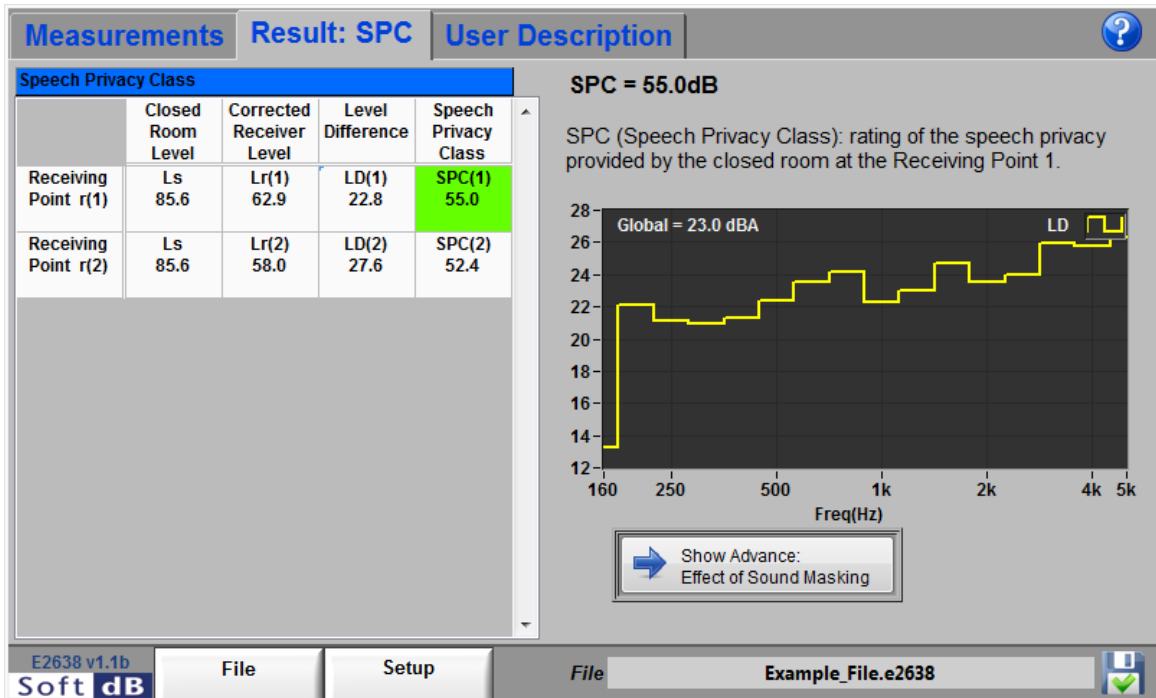

Step 6 *Measure the levels at the desired receiving point(s), source ON*

- Microphone at least 0.25 m from the outer surface of the closed room
- Microphone between 1.2 and 2 m above the floor
- The recommended average time is 15 seconds according to the E2638-10 standard

Step 7 *Measure the levels at the desired receiving point(s), source Off*

- Repeat last step with source turned off.

Step 8 Analyze the results

The Result Tab displays the results of the speech privacy of the room.

The measurements can be saved and exported through the menu of the  button.

The following table gives some indications on how to interpret the Speech Privacy Class (SPC).

65dB < SPC < 70dB low speech privacy	
70dB < SPC < 75dB Minimal Speech Privacy	One or two words will be intelligible at most once each 3 minutes, and speech sounds will frequently be audible (at most once each 0.6 minutes).
75dB < SPC < 80dB Standard Speech Privacy	One or two words will be occasionally intelligible (at most once each 18 minutes) and frequently audible (at most once each 2 minutes).
80dB < SPC < 85dB Standard Speech Security	One or two words will rarely be intelligible (at most once each 2.3 hours) and occasionally audible (at most once each 12.5 hours).
85dB < SPC < 90dB High Speech Security	Speech essentially unintelligible (at most once each 16 hours) and very rarely audible (at most once each 1.5 hours)
SPC > 90dB Very High Speech Security	Speech not intelligible and very rarely audible (at most once each 11 hours)

8.2 E2638 Main Interface

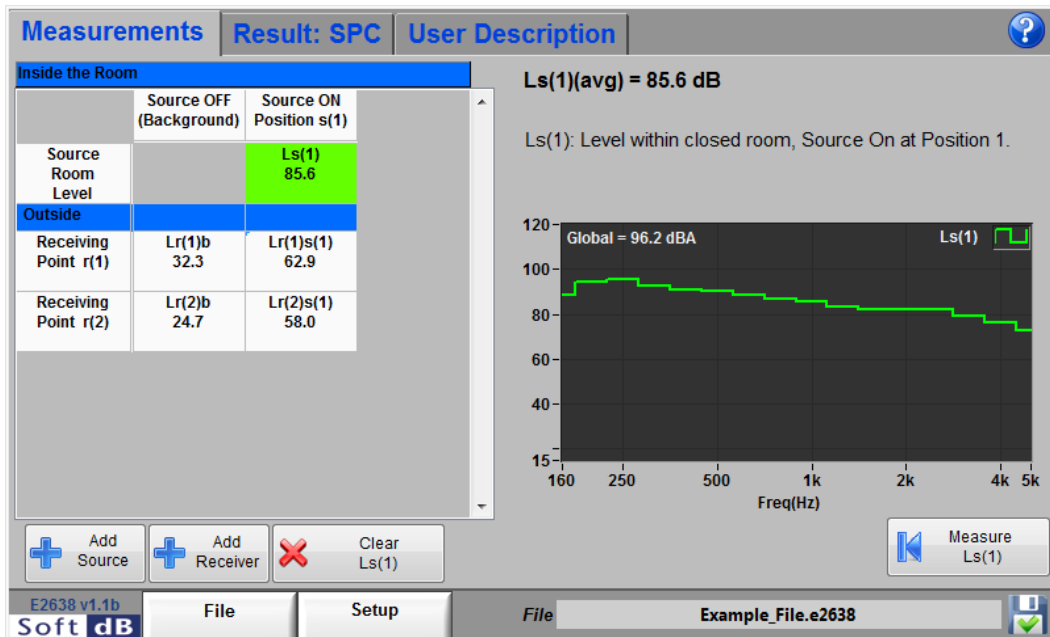

Figure 15 : Main interface

The main interface mainly contains three tabs and a menu bar.

Main controls and indicators

	Main interface tabs:
	Measurements tab (section 8.4, p.95)
	Result tab (section 8.5, p.99)
	User Description tab (section 8.6, p.101)
	File Menu button (see the following table).
	Setup button that calls the setup interface (section 8.3 , p.92).
	Module name and version number.
	File name of the measurement. A green check on the disk icon indicates that the data are saved.
	Click this button to display the help window. This help is a reminder of the steps and the rules to follow.

File Menu

<div style="border: 1px solid black; padding: 5px; width: fit-content;"> <p>New</p> <p>Open</p> <p>Save</p> <p>Save As...</p> <p>Export</p> <p>File Manager</p> <p>Quit</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin-top: 5px;"> <p>File</p> </div>	New	Creates a brand new measurement session.
	Open	Opens a previous measurement file.
	Save	Saves the current measurement into the specified file.
	Save As...	Saves the current measurement into a new file.
	Export	Exports the measurement data into a text file. The file is saved as .xls extension and can be opened with Microsoft Excel or any text editor.
	File Manager	Launches the File Manager (see section 11, p.124)
	Quit:	Allows to quit the module and to return to the Opus Suite Interface.

8.3 E2638 Setup Interface

The screenshot shows the 'Setup interface' for the E2638 device. It is divided into three main sections:

- Input Setup:** Includes fields for Channel (1), Type (ICP), Range (25-119 dBA), Sensitivity (50.0 mV/Pa), a 'Calibrate' button, and dBref (2E-5).
- Source Setup:** Includes SourceType (PinkNoise), Output Channel (1-2 (differential)), Volume (50%), and a 'Test Source' button.
- Measurement Setup:** Includes Average Type (Leq), Average Period (30 sec), and sub-sections for 'Within Room', 'At Receiver, SourceOFF', and 'At Receiver, SourceON' with their respective time settings (15 sec).

At the bottom right, there are 'Cancel' and 'OK' buttons.

Figure 16 : Setup interface

Input Setup

Channel 1	The input channel used for the measurements
Type ICP	The available input types are AC and ICP sensors.
Range 25-119 dBA	Selection of the dynamic range. For a microphone sensitivity of 50mV/Pa. <ul style="list-style-type: none"> • Low Range: 25 to 119 dBA • High Range: 37-130 dBA <u>Concerto</u> : the input 1 and 2 have two range settings (Low or High) while inputs 3 and 4 have a single fixed range (Low) <u>Alto and Conductor</u> : only the low range is available.
Sensitivity 50.0 mV/Pa	The sensor sensitivity can be entered manually or the Calibration interface can be used (see section 8.3.1, p.94).
dBref 2E-5	The dB reference is the unit reference from which the decibel (dB) is calculated.

Source Setup

<p>Source Type</p> <p>PinkNoise</p> <p>↓</p> <p>✓ PinkNoise WhiteNoise External</p>	<p>There is a noise generator on the unit that can generate either pink noise or white noise. If an external generator is used, the source type can be set to External to disable the internal generator.</p>
<p>Output Channel</p> <p>1-2 (differential)</p> <p>↓</p> <p>1 (single end) 2 (single end) ✓ 1-2 (differential)</p>	<p>The internal generator can be outputted in single end on channel 1 or channel 2. The differential output using both channels can also be used.</p>
<p>Volume</p> <p>50%</p>	<p>The volume of the internal generator can be adjusted from 0 to 100%.</p>
<p>▶ Test Source</p>	<p>The Test Source button allows the user to test the source by using the standard measurement interface.</p>

<p>Y-axis range</p> <p>Y min 15</p> <p>Y max 120</p>	<p>The Ymin and Ymax parameters set the vertical scale (levels in dB) of the spectrum graphs of the current module.</p>
---	---

8.3.1 Sensor Calibration

The input sensitivity can be calibrated using the calibration function and a sensor calibrator. Click the **Calibrate** button on the Setup interface to launch the Calibration interface.

Figure 17: Sensor Calibration Interface

Step 1 Adjust the calibration parameters

The default values are:

- Averaging time: 5 s
- Frequency: 1 kHz
- Calibrator Level: 94 dB

Step 2 Install the calibrator device on the microphone

Step 3 Click START

After the average time is elapsed, the sensitivity value will update.

Step 4 Click OK to accept the sensitivity value

8.4 E2638 Measurements tab

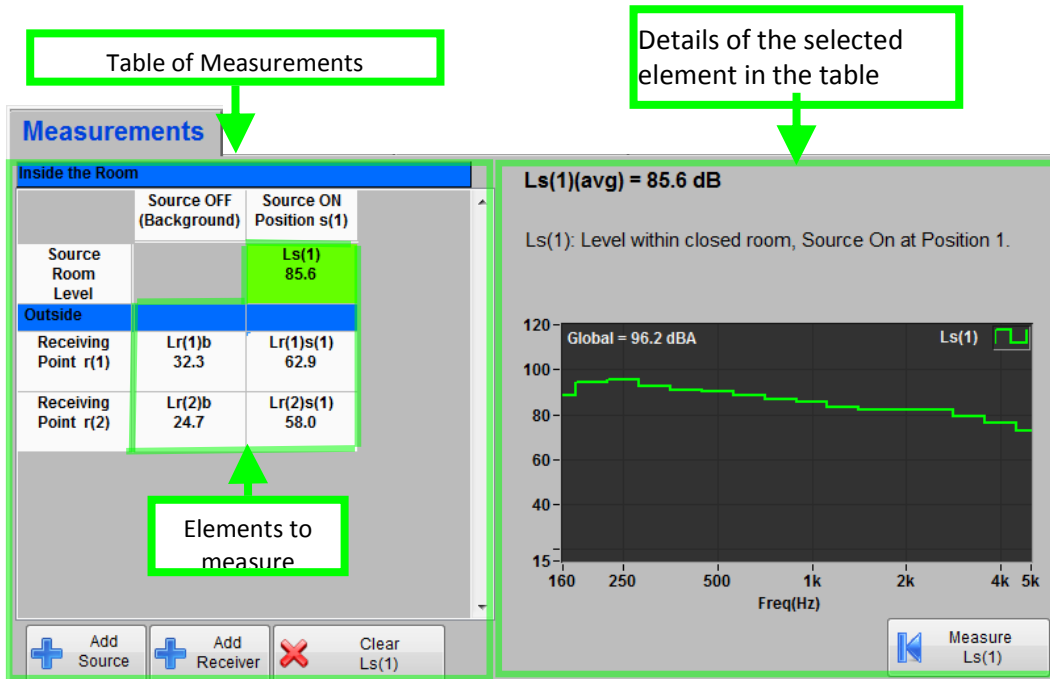

Figure 18: Measurements tab

The Measurements tab can be divided in two parts. The Measurements Table is on the left side and the details on the right side. The user can select an element in table and its details will be displayed.

Measurements tab buttons

	Open the measurement interface (see section 8.4.1, p.97). The selected element in the table (in green) will be measured.
	Add a source position in the closed room.
	Add a receiving point outside the closed room.
	Click this button to clear/remove the selected table element. To remove a source position or a receiving point, select the corresponding header. To clear a measurement, select the corresponding element in the upper table.

The table of measurements contains a row of headers, a column of headers and the elements to measure. The table is expandable horizontally and vertically as source positions and receiving points are added.

Table of Measurements

Source Room Level	Header of room levels (Ls) measured within the closed room while the source is activated.	
Receiving Point r(1)	Header of a receiving point. Click this element to access the description of the receiving point.	
Source OFF (Background)	Header of the background noise at each receiving point.	
Source ON Position s(1)	Header of a source position. Click this element to access the description of the source position.	
	Ls(1) 85.6	All other elements of the table are measurements to complete.
Lr(1)b 32.3	Lr(1)s(1) 62.9	
Lr(2)b 24.7	Lr(2)s(1) 58.0	

Details of the selected element in the table

<p><i>If a measurement element is selected...</i></p> <p>Ls(1)(avg) = 85.6 dB</p> <p>Ls(1): Level within closed room, Source On at Position 1.</p> 	<p>Data name and average value in dB of the selected element.</p> <p>Description of the selected element</p> <p>Spectrum graph and global value of the selected element.</p>
<p><i>If a Header element is selected...</i></p> <p>Description of Source Position 1</p>	<p>A description of every source position and receiving point can be entered by selecting the corresponding header in the table.</p>

8.4.1 Measurement Interface

Figure 19: Measurement Interface

Table of Measurements

Start Average Pause	The Start Average button starts the average measurements. Once pressed, the button becomes a Pause button. The measurement will stop by itself at the end of the average period.
Stop	The Stop button stops the average process
Reset	The Reset button restarts the average measurement.
6 sec	Progress bar of the average time.
Average Type: Leq Average Period: 30 sec	The average parameters of Average type and Average Period can be modified directly on the Measurement Interface. The values will be updated in the corresponding value of the Setup Interface (see section 8.3, p.92)

Soft dB

	<p>The dynamic range gives the information of the usage of the input range. When saturation occurs the indicator turns red. The word 'Sat' will also be displayed over the indicator as soon as saturation is detected during an average. Such a measurement should be rejected.</p>
	<p>If enabled the graph will rescale as an average ends.</p>
	<p>Once the measurement is acceptable, press the Accept button to return to the main interface.</p>

8.5 E2638 Result tab

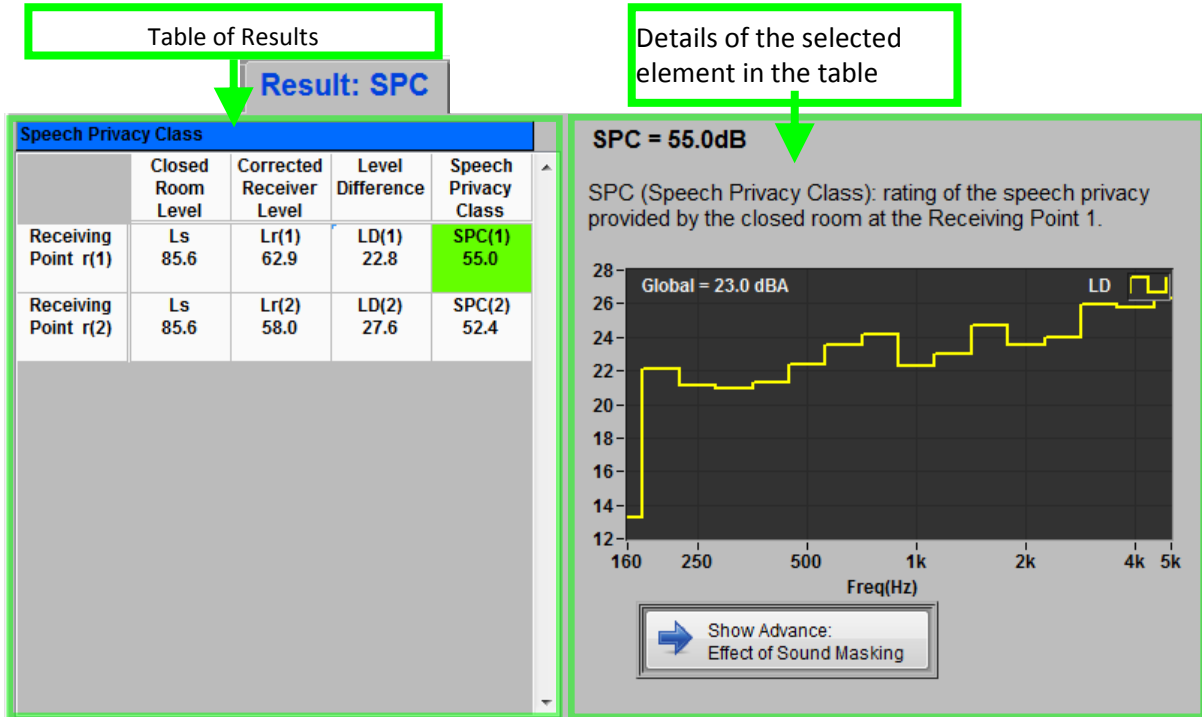

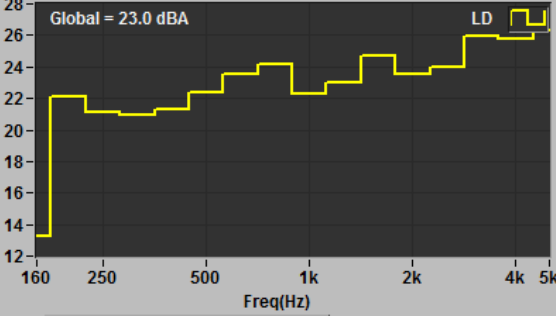

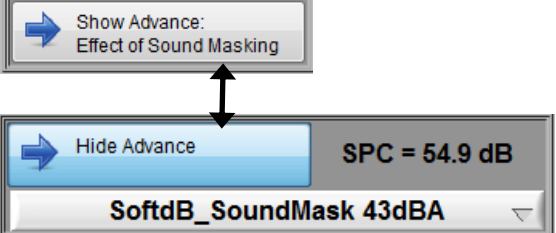

Figure 20: Result tab

The Result tab contains the table of results and the details on the right side. The table is expandable vertically as receiving points are added (in the Measurements tab).

Table of Results

Closed Room Level	Header of average room level (Ls) measured within the closed room while the source is activated. By definition, the same room level is used for every receiving point.
Corrected Receiver Level	Header of average level at a receiving point while the source is activated. The level may have been corrected for the background noise if the measurement with the source activated was too close of the background.
Level Difference	Header of level differences (the difference in average source room level and average level at a receiving point).
Speech Privacy Class	Header of Speech Privacy Class (rating of the speech privacy provided by the closed room). Refer to the section 8.5.1 (p.100) for the interpretation of the SPC result. If at least two source positions have been used, a confidence interval will also be displayed.
Receiving Point r(1)	Header of receiving points. Each row of the table contains the result for a receiving point.

Details of the selected element in the table

<p>SPC = 55.0dB</p> <p>SPC (Speech Privacy Class): rating of the speech privacy provided by the closed room at the Receiving Point 1.</p> 	<p>Name and value in dB of the selected element. Description of the selected element</p> <p>Spectrum graph and global value of the selected element.</p>
	<p>This button is only available when a SPC element is selected.</p> <p>Click on the 'Show Advance' to simulate the effect of changing the background noise. A new SPC result is calculated according to the background selected.</p>

8.5.1 Interpretation of the Speech Privacy Class

<p>65dB < SPC < 70dB Low Speech Privacy</p>	
<p>70dB < SPC < 75dB Minimal Speech Privacy</p>	<p>One or two words will be intelligible at most once each 3 minutes, and speech sounds will frequently be audible (at most once each 0.6 minutes).</p>
<p>75dB < SPC < 80dB Standard Speech Privacy</p>	<p>One or two words will be occasionally intelligible (at most once each 18 minutes) and frequently audible (at most once each 2 minutes).</p>
<p>80dB < SPC < 85dB Standard Speech Security</p>	<p>One or two words will rarely be intelligible (at most once each 2.3 hours) and occasionally audible (at most once each 12.5 hours).</p>
<p>85dB < SPC < 90dB High Speech Security</p>	<p>Speech essentially unintelligible (at most once each 16 hours) and very rarely audible (at most once each 1.5 hours)</p>
<p>SPC > 90dB Very High Speech Security</p>	<p>Speech not intelligible and very rarely audible (at most once each 11 hours)</p>

8.6 E2638 User Description tab

Figure 21: User Description tab

The User Description tab on the main panel can be used as a general note pad that will be saved along with the measurement data.

9 E1130 Module

General Specifications

Standard	Test Method E1130-02, by ASTM International Standard Test Method for Objective Measurement of the Speech Privacy in Open Offices using Articulation Index. It is designed to measure the degree of speech privacy between locations in open offices, indicating the degree to which a conversation occurring at a talker location is kept private from the listener at a listener location.
Software Features	Intuitive interface for E1130 measurement Embedded noise generator (white or pink noise) Real time 1/3 octave band spectrum (IEC 1260 Type 1) Automated calculation of the Privacy Index (PI) Expendable interface for multiple listener locations Save, load and export measurement files

9.1 E1130 Quick Start

The E1130 module (Speech Privacy in Open Offices) is part of the Building Acoustics. It can be accessed in the Building Acoustics menu of the Opus Suite panel (see **Erreur ! Source du renvoi introuvable.**).

Measurement tab

The screenshot shows the 'Measurements' tab in the software. It features a table for 'Reference Source at Talker location' with the following data:

Description	SMS-PLN with compact SGA
Signal Generator	External
Ref. Source Level	Ls 90.7 dBA

Below this is a 'Listener Location' table:

Listener Location	Ambient at Listener	Source at Listener
Point #1	Lr(1)b ?	Lr(1)s ?

The graph on the right displays 'Level (dB)' on the y-axis (ranging from 20 to 90) and 'Frequency (Hz)' on the x-axis (logarithmic scale from 125 to 8k). A yellow box in the center of the graph contains the text: 'No data yet. Please proceed to the measurement.'

At the bottom, there are buttons for 'Add Point', 'Clear Lr(1)b', and 'Measure Lr(1)b'. The 'Measure Lr(1)b' button is highlighted with a green callout box that says 'Measure the selected element'.

What you should know...

- The main interface let you add/remove listener location points.
- A text description can be entered for each point. Click on the corresponding header in the table to display the text box.
- The selected element of the table shows a **green background**. The details of the selection are displayed on the right side of the table.
- The elements still to measure display a question mark (?) as a value and have a **yellow background**.

Step 1 Setup the unit

Input Setup									
Channel	Type	Range	Sensitivity		dBref				
1	ICP	25-119 dBA	50.0 mV/Pa		2E-5		Calibrate		

Measurement Setup		SourceOFF		SourceON		Graph Setup	
Average Period	20 sec	20 sec			Y-axis range		
Average Type	L95%	Leq			Y min	20	
Average Method	Moving average			Y max	90		

Cancel OK

Setup

Click on the **Setup** button to access the setup interface. The parameter should typically be set as shown on figure above.

Before a measurement, the operator should set the sensitivity of the sensor used. This sensitivity can be set manually if it is known. Preferably, the sensor sensibility should be set by using the software calibration tool and a calibrator. To do so, click on **Calibrate** and follow the instructions of the Sensor Calibration (section 9.3.1, p.112).

OK

Click **OK** to return to the main panel.

Step 2 Do a Measurement

Measurement of Level at the Listener location 1, Source OFF

Moving average around the listener

4 positions around the listener

Accept

Start the Average

Accept the measurement

To proceed to a measurement, select an element to measure in the table of the main panel and click

the button  to open the measurement interface.

Once in the measurement panel, click on the  button to start the average measurement. The acquisition ends by itself once the average period is reached (as set in setup) and can be stopped at any time.

Click on the  button to accept the measurement.

You are now ready to follow the measurement procedure.

Step 3 *Talker Location Setup*

- A qualified conventional directional loudspeaker should be used
- Location 1.2 m above the floor
- Speaker directed toward the listener location.
- Speaker inclined 25° above the horizontal

Step 4 *Ambient Measurement*

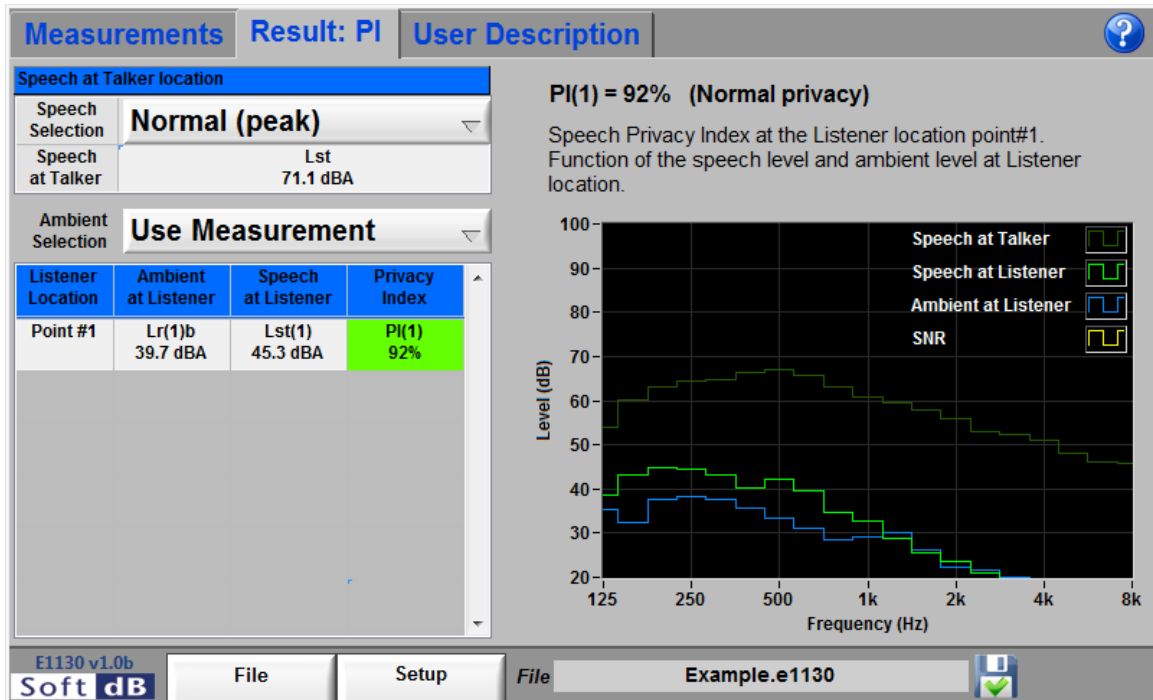

Measure the sound level at the listener location while the source is off.

- Average of 4 positions around the defined listener location (E1130 standard).
Measurement at 4 equally spaced positions around a virtual circle of 0.3 m radius centered on the defined location. Use at least 4 seconds average time.
- Optionally, the single moving average can be done instead of the 4 position method. A average time of at least 15 seconds should be used
- Measured level must exceed Ambient level by 10 dB in each band
- 1.2 m above the floor
- If the preceding conditions cannot be met, the usual worker's position is used
- Microphone directed upwards

Step 5 *Level Reduction Measurement*

Measure the sound level at the listener location while the source is on. Repeat previous step with source on.

Step 6 Analyze the results

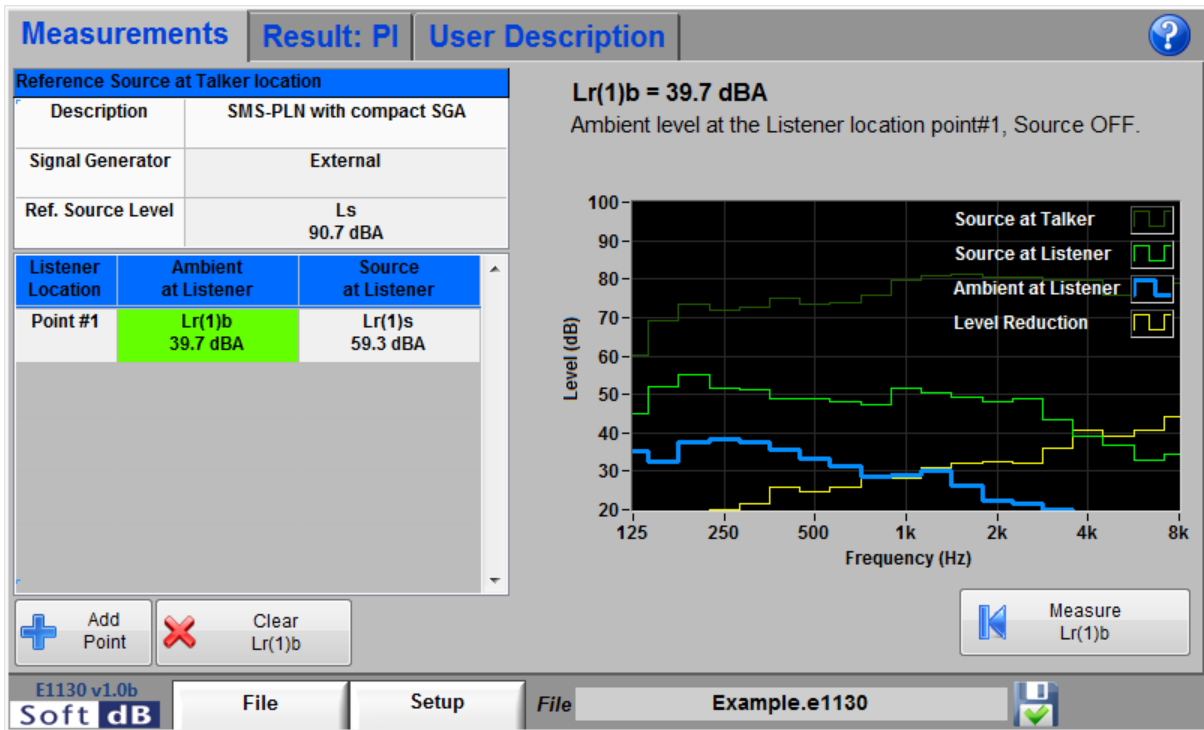

The Result Tab displays the results of the speech privacy of the room.

The measurements can be saved and exported through the menu of the  button.

The following table gives some indications on how to interpret the Speech Privacy Class (SPC).

0% < PI < 60%	Essentially no privacy.
60% < PI < 70%	Unacceptable privacy
70% < PI < 80%	Poor privacy. Speech becomes more readily understood
80% < PI < 95%	Normal privacy. Understanding speech requires concentrated effort
95% < PI < 100%	Confidential speech privacy. Speech cannot be understood

9.2 E1130 Main Interface

The main interface mainly contains three tabs and a menu bar.

Main controls and indicators

 	Main interface tabs: <ul style="list-style-type: none"> • Measurements tab (section 9.4, p.113) • Result tab (section 9.5, p.120) • User Description tab (section 9.6, p.122)
	File Menu button (see the following table).
	Setup button that calls the setup interface (section 9.3, p.110).
	Module name and version number.
	File name of the measurement. A green check on the disk icon indicates that the data are saved.
	Click this button to display the help window. This help is a reminder of the steps and the rules to follow.

File Menu

<div style="border: 1px solid black; padding: 5px; width: fit-content;"> <p>New</p> <p>Open</p> <p>Save</p> <p>Save As...</p> <p>Export</p> <p>File Manager</p> <p>Quit</p> </div> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin-top: 5px;"> <p>File</p> </div>	New	Creates a brand new measurement session.
	Open	Opens a previous measurement file.
	Save	Saves the current measurement into the specified file.
	Save As...	Saves the current measurement into a new file.
	Export	Exports the measurement data into a text file. The file is saved as .xls extension and can be opened with Microsoft Excel or any text editor.
	File Manager	Launches the File Manager (see section 11, p. 124)
	Quit:	Allows to quit the module and to return to the Opus Suite Interface.

9.3 E1130 Setup Interface

The screenshot shows the E1130 Setup Interface with the following settings:

- Input Setup:** Channel: 1, Type: ICP, Range: 25-119 dBA, Sensitivity: 50.0 mV/Pa, dBref: 2E-5. A Calibrate button is visible next to the Sensitivity field.
- Measurement Setup:**
 - Average Period: 20 sec (SourceOFF), 20 sec (SourceON)
 - Average Type: L95% (SourceOFF), Leq (SourceON)
 - Average Method: Moving average
- Graph Setup:** Y-axis range: Y min: 20, Y max: 90.

Buttons for Cancel and OK are located at the bottom right of the interface.

Figure 22: Setup interface

Input Setup

Channel 1	The input channel used for the measurements
Type ICP	The available input types are AC and ICP sensors.
Range 25-119 dBA	Selection of the dynamic range. For a microphone sensitivity of 50mV/Pa. <ul style="list-style-type: none"> • Low Range: 25 to 119 dBA • High Range: 37-130 dBA Concerto: the input 1 and 2 have two range settings (Low or High) while inputs 3 and 4 have a single fixed range (Low). Alto and Conductor: only the low range is available.
Sensitivity 50.0 mV/Pa	The sensor sensitivity can be entered manually or the Calibration interface can be used (see section 9.3.1, p.112).
dBref 2E-5	The dB reference is the unit reference from which the decibel (dB) is calculated.

Measurement Setup

Average Period 20 sec	The average period of the two types of measurement can be adjusted independently.
Average Type Leq ↓ ✓ Leq L99% L95% L90% L50%	The average type of the two types of measurement can be adjusted independently. It can be adjusted to be a plain average (Leq) or a statistic level (Lx%). Using the statistics instead of the Leq can minimize the punctual noise events that may occur during a measurement (especially for the background).
Average Method Moving average	The standard method would normally use the 4 Positions method. However, a moving average around the listener location would do as well.

Graph Setup

Y-axis range Y min 15 Y max 120	The Ymin and Ymax parameters set the vertical scale (levels in dB) of the spectrum graphs of the current module.
--	--

9.3.1 Sensor Calibration

The input sensitivity can be calibrated using the calibration function and a sensor calibrator. Click the **Calibrate** button on the Setup interface to launch the Calibration interface.

Figure 23: Sensor Calibration Interface

Step 1 Adjust the calibration parameters

The default values are:

- Averaging time: 5 s
- Frequency: 1 kHz
- Calibrator Level: 94 dB

Step 2 Install the calibrator device on the microphone

Step 3 Click START

After the average time is elapsed, the sensitivity value will update.

Step 4 Click OK to accept the sensitivity value

9.4 E1130 Measurements tab

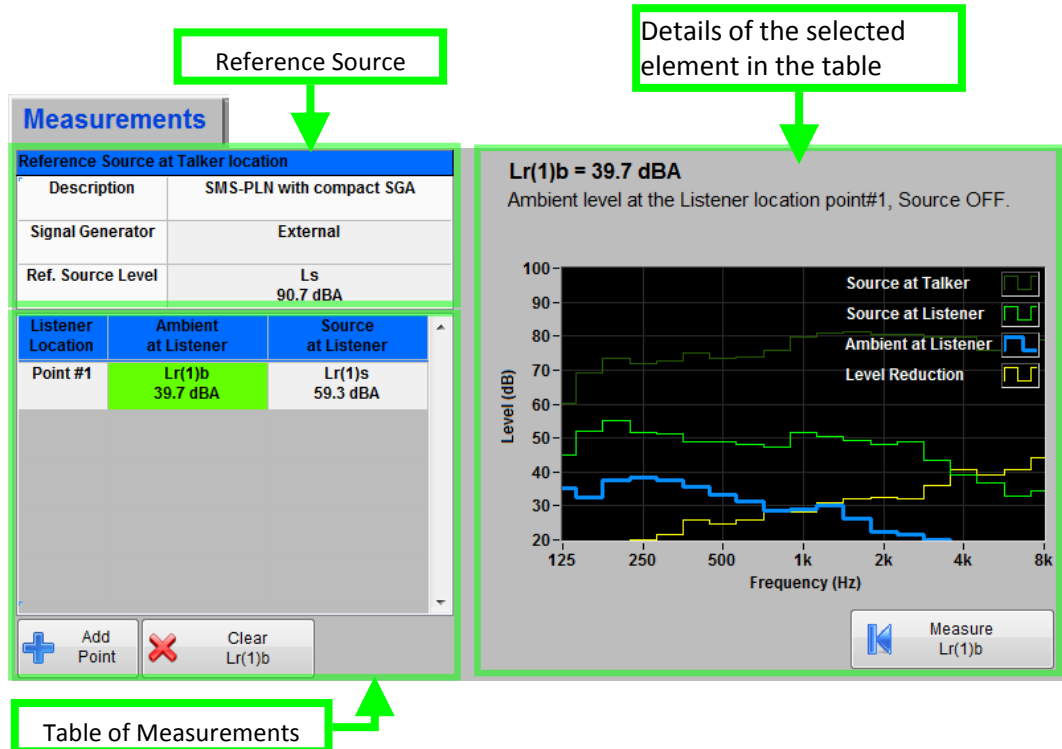

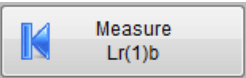

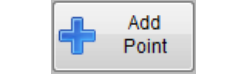

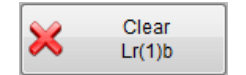

Figure 24: Measurements tab

The Measurements tab can be divided in three parts. The reference source is in upper left corner. Just under is the table of measurements. Finally, the details of the selected element are on the right side.

Measurements tab buttons

	<p>If a element of the table is selected, the measurement interface will be called (see section 9.4.3, p.118). If the Reference Source is selected, the Reference Sound Source setup will be called (see section 9.4.1, p.115).</p>
	<p>Add a listener location point.</p>
	<p>Click this button to clear/remove the selected table element. To remove a listener location point, select the corresponding header. To clear a measurement, select the corresponding element.</p>

Reference Source

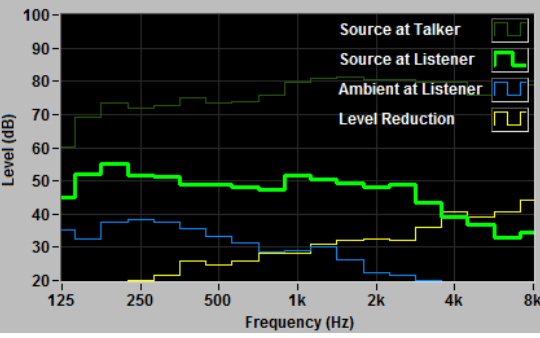

Reference Source at Talker location		
Description	SMS-PLN with compact SGA	Description of the qualified sound source used.
Signal Generator	External	Setting of the embedded noise generator of the unit.
Ref. Source Level	Ls 90.7 dBA	Global level of the reference sound source.

Table of Measurements

Listener Location Point#1	
----------------------------------	--

9.4.1 Reference Sound Source Setup

The E1130 test method requires a qualified reference sound source. The qualification of this reference source should be done in an anechoic chamber. On the field, the operator must ensure that all the parts of equipment (noise generator, amplifier, speaker) and the settings (volume, noise shape) are the same as in the qualification.

In order to setup the reference source, click on the reference source area on the measurement tab

and click on the  button. The following interface will be called.

Band (Hz)	Level (dB)
125	60.2
160	69.0
200	73.5
250	71.7
315	72.6
400	74.9
500	73.5
630	74.0
800	75.7
1000	79.6
1250	81.1
1600	81.5
2000	80.4
2500	80.6
3150	79.5
4000	79.6
5000	76.0
6300	73.8
8000	78.9

Table of Results

The Result tab contains the speech selection and ambient selection that will be used to evaluate the privacy index. The tab also contains the table of result and the details on the right side. The table is expendable vertically as listener location points are added (in the Measurements tab).

Speech & Ambient Selection

Speech at Talker location	
Speech Selection	Normal (peak)
Speech at Talker	Lst 71.1 dBA
Ambient Selection	Use Measurement

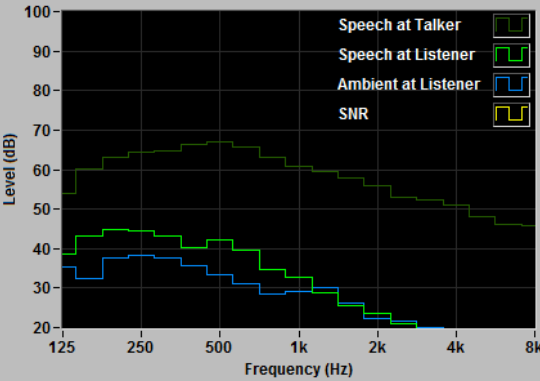

The speech selection is used in the calculation of the privacy index to simulate a conversation at the talker location. Normal speech is usually used for this purpose.

The ambient level is required for the calculation of the privacy index. Normally the measured ambient level is used for this purpose. However, it may be interesting to simulate the effect of changing the background noise on the privacy index.

Table of Results

Listener Location Point #1	Header of a listener location point.
Ambient at Listener Lr(1)b 39.7 dBA	Background level (according to the Ambient Selection) at a listener location point while the source is turned off.
Speech at Listener Lst(1) 45.3 dBA	Simulated speech level (according to the Speech Selection) at the listener location point.
Privacy Index PI(1) 92%	Privacy Index. Refer to the section 9.5.1 (p.121) for the interpretation of the SPC result.

Details of the selected element in the table

<p>PI(1) = 92% (Normal privacy)</p> <p>Speech Privacy Index at the Listener location point#1. Function of the speech level and ambient level at Listener location.</p>  <p>The graph displays four data series: 'Speech at Talker' (red), 'Speech at Listener' (green), 'Ambient at Listener' (blue), and 'SNR' (yellow). The y-axis represents Level in dB from 20 to 100, and the x-axis represents Frequency in Hz on a logarithmic scale from 125 to 8k. The SNR curve shows a consistent difference between the speech and ambient levels across the frequency spectrum.</p>	<p>Name and value of the selected element. Description of the selected element</p> <p>Spectrum graph of the selected listener location point. The SNR is the Sound-to-Noise Ratio, which is the difference between the speech level and the ambient level at the listener location.</p>

9.5.1 Interpretation of the Speech Privacy Class

The following table gives some indications on how to interpret the Speech Privacy Class (SPC).

0% < PI < 60%	Essentially no privacy.
60% < PI < 70%	Unacceptable privacy
70% < PI < 80%	Poor privacy. Speech becomes more readily understood
80% < PI < 95%	Normal privacy. Understanding speech requires concentrated effort
95% < PI < 100%	Confidential speech privacy. Speech cannot be understood

9.6 E1130 User Description tab

The User Description tab on the main panel can be used as a general note pad that will be saved along with the measurement data.

10 Explorer Dialog

Explorer Window Controls and Indicators

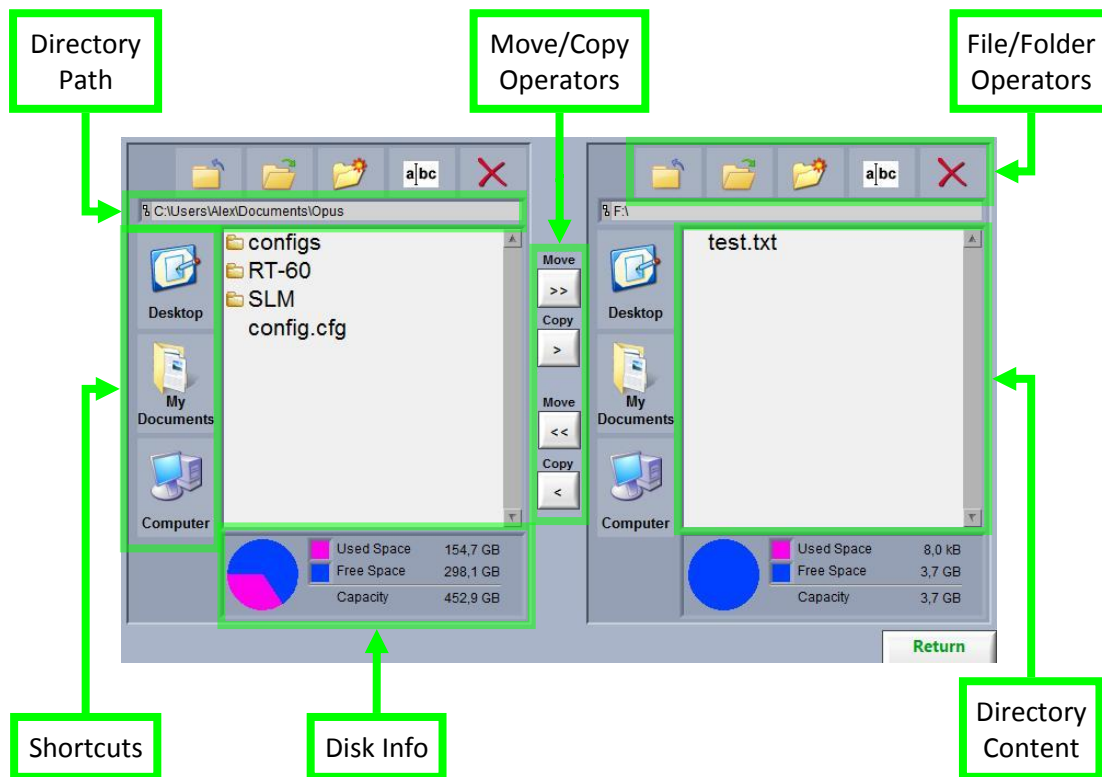

File/Folder Operators	<ul style="list-style-type: none"> • Go to parent directory • Open directory • Create new folder • Rename folder or file • Delete folder or file
Directory Path	Displays the path of the active directory.

Directory Content	<p>Displays the content of a directory and responds to common actions:</p> <ul style="list-style-type: none"> • Single clicking on an element selects it. • Double clicking on a directory opens it.

11 File Manager

The File manager is used to perform most file operations:

- Navigate the directory structure
- Create folders
- Rename files and folders
- Move or copy files and folders from one place to another
- Delete a file or a folder

Although not very useful on a stand-alone computer, this manager is necessary on the *Concerto*, on which Windows explorer is unavailable. Its primary function is to allow the user to manage the *Concerto* directory structure and to export files and folders to a USB memory stick.

Directory Path	Displays the path of the active directory.
Shortcuts	<p>Allows easy access to common directories. When the File Manager is used on a stand-alone computer, these shortcuts are linked to:</p> <ul style="list-style-type: none"> • Desktop • My Documents • Computer <p>When the File Manager is used on a <i>Concerto</i>, the shortcuts are linked to:</p> <ul style="list-style-type: none"> • Opus Root • USB Device.
Move/Copy Operators	Copies or moves a file or folder from a source to its destination.
File/Folder Operators	<p>Allows user to:</p> <ul style="list-style-type: none"> • Go to parent directory • Open directory • Create new folder • Rename folder or file • Delete folder or file
Directory Content	<p>Displays the content of a directory and responds to common actions from the user:</p> <ul style="list-style-type: none"> • Single clicking on an element will select it • Double clicking on a directory will open it • Dragging an element from one side to the other will copy it.

Appendix 1: Concerto Hardware

Connections

Power on/off

<p>Turn On</p>	<p>Press the trigger button located at the back of the unit This key has two (2) functions:</p> <ol style="list-style-type: none"> 1. To turn the unit ON. 2. Start a measurement once the SLM Module is loaded <p>After a few seconds, the Opus Environment Interface will appear.</p>
<p>Stand-by</p>	<p>The stand-by mode allows fast load time.</p> <ul style="list-style-type: none"> • To put the unit on stand-by, click the Turn Off button. <p>Note: The unit can be in stand-by for more than three days without recharging, provided batteries are fully charged prior to storage.</p>
<p>Shutdown</p>	<p>To Shut down the unit, click and hold the Turn Off button for five seconds.</p>

Power Reset

If the Concerto happens to crash and it is not possible to take back the control, a power reset might be necessary. To complete the power reset, the three buttons on the front of the Concerto must be used.

Here is the procedure:

- Step 1** *Press and hold the Function, Enter and Down Arrow button for 5 seconds until the Concerto shuts down*
- Step 2** *Wait 5 seconds and press the power button*
- Step 3** *Wait 5 seconds and press the power button a second time to restart the Concerto from a power reset.*

Step 1

Press and hold to trigger the power reset

Step 2 and 3

Power-on

Press 2 times to restart from power reset

Inputs and Signal Processing Specifications (Embedded Signal Ranger MK3 DSP Board)

DSP Processor	Texas Instruments TMS320C6424
Inputs	4
Outputs	2
Linear Range	2 x (25-120 dBA or 30-130 dBA) + 2 x (25-120 dBA)
Conditioning	AC, DC, ICP (4 mA)

Physical (DAP Tech 9000 Tablet PC)

Operating system	Intel Atom E660T 1.3 GHz
Storage	16 GB SSD
Data Transfer	USB
Display	180 mm (7 inches) WVGA (800 x 480)
Dimensions	230 x 185 x 60mm (9.0 x 7.3 x 2.4 inches)
Weight	1350 g (2.96 lb)
Battery	2 x Li-ion battery, 7.4 V, 3100 mAh, (1 internal + 1 hot-swappable)
Power	10-20 VDC, 2A
Protection rating	IEC 68-2-32 method 1 (Multiple 1m drops on concrete) IP67 (Rain, Humidity, 1 meter immersion) MIL-STD-810F method 506.4 procedure I (windblown rain) Humidity: 95% non-condensing Temperature: MIL-STD-810-F (-20 °C ... +50 °C); Vibration: MIL-STD 810E 514.5

Appendix 2: 1/3 Octave Filters – IEC 61260 Class 1/ANSI S1.11

1/3 Octave Filters

The 1/3 octave filters are computed at low-level in real time (at 48 kHz) on the digital signal processor (DSP) of the Concerto system. The filters comply with all requirements of IEC 61260 for Class 1.

Frequency Range

20 Hz to 20 kHz.

Filter Shape

The following curve presents the filter shape test done for the 1000 Hz 1/3 octave band. The red and green curves represent the limits associated with the IEC standard (Class 1).

Shape Test Numerical Results at 1 kHz

The following table presents the numerical results of the shape test at 1 kHz:

Frequency (Hz)	Low limit (dB)	Measurement (dB)	High limit (dB)
185.5	-inf	-96.0	-75.0
327.5	-inf	-85.1	-62.0
531.4	-inf	-61.1	-42.5
772.6	-inf	-28.2	-18.0
891.3	-4.5	-3.0	-2.3
919.6	-1.1	-0.3	0.15
947.0	-0.4	0.0	0.15
974.0	-0.2	0.0	0.15
1000.0	-0.15	0.0	0.15
1026.7	-0.2	0.0	0.15
1055.8	-0.4	0.0	0.15
1087.5	-1.1	-0.3	0.15
1122.0	-4.5	-3.0	-2.3
1294.4	-inf	-28.4	-18.0
1881.7	-inf	-61.8	-42.5
3053.7	-inf	-86.9	-62.0
5392.0	-inf	-96.7	-75.0

1/3 Octave Filter Linearity

The linearity of the 1/3-octave filter has been measured for both ranges (low and high). The experimentation is done with an adaptor (ADP092) and an electric signal. The results in dB are for an input sensitivity of 50 mV/Pa. The maximum and the minimum linear levels are measured for each 1/3 octave band along with the noise floor.

Filter Linearity (Low Range)

Frequency (Hz)	Saturation Level (dB)	Minimum Linear Level (dB)	Linear Dynamic Range (dB)	Noise Floor (dB)
20	120.5	39.5	81.0	1.3
25	120.5	34.2	86.3	0.7
31.5	120.5	33.2	87.3	2.0
40	120.5	30.6	89.9	1.2
50	120.5	30.0	90.5	1.1
63	120.5	28.1	92.4	3.2
80	120.5	27.8	92.7	0.4
100	120.5	27.4	93.1	-0.4
125	120.5	27.2	93.3	1.4
160	120.5	27.0	93.5	0.0
200	120.5	26.7	93.8	0.4
250	120.5	23.4	97.1	0.7
315	120.5	24.1	96.4	1.3
400	120.5	23.5	97.0	1.8
500	120.5	23.5	97.0	2.3
630	120.5	24.0	96.5	3.2
800	120.5	24.1	96.4	3.4
1000	120.5	24.1	96.4	4.3
1250	120.5	24.5	96.0	5.2
1600	120.5	24.5	96.0	6.1
2000	120.5	24.2	96.3	7.1
2500	120.5	24.5	96.0	8.2
3150	120.5	24.6	95.9	9.2
4000	120.5	24.7	95.8	10.1
5000	120.5	25.1	95.4	11.3
6300	120.5	25.2	95.3	12.6
8000	120.5	25.8	94.7	14.0
10000	120.5	26.3	94.2	16.9

Soft dB

Frequency (Hz)	Saturation Level (dB)	Minimum Linear Level (dB)	Linear Dynamic Range (dB)	Noise Floor (dB)
12500	120.5	27.0	93.5	17.5
16000	120.5	27.6	92.9	19.5
20000	120.5	28.3	92.2	19.7

Filter Linearity (High Range)

Frequency (Hz)	Saturation Level (dB)	Minimum Linear Level (dB)	Linear Dynamic Range (dB)	Noise Floor (dB)
20	132.5	51.5	81.0	7.3
25	132.5	49.2	83.3	5.3
31.5	132.5	47.1	85.4	2.0
40	132.5	44.2	88.3	7.9
50	132.5	41.8	90.7	9.3
63	132.5	39.1	93.4	9.1

20000	132.5	37.1	95.4	27.7

1/3 Octave Filter Summation

For this test, sine waves from 20 Hz to 20 kHz are measured with the Concerto system. For each sine wave the summation of the 1/3 octave filters is computed to form the following curves. The sine waves are electrical signals at 1 VRMS. The next figures present the results for both input range.

Summation Test (Low Range Case)

Summation Test (High Range Case)
